THE UNITED STATES INTERNATIONAL TRADE COMMISSION

In the Matter of:) Investigation No.:
) 731-TA-991
SILICON METAL FROM RUSSIA) (Preliminary)

Tuesday,
March 26, 2002

Room No. 101
U. S. International
Trade Commission
500 E Street, S.W.
Washington, D.C.

The preliminary conference commenced, pursuant to Notice, at 9:30 a.m., at the United States International Trade Commission, LYNN FEATHERSTONE, Director of Investigations, presiding.

APPEARANCES:

On behalf of the International Trade Commission:

Staff:

LYNN FEATHERSTONE, DIRECTOR OF INVESTIGATIONS
BONNIE NOREEN, SUPERVISORY INVESTIGATOR
FRED FISCHER, INVESTIGATOR
IRENE CHEN, ATTORNEY/ADVISOR
CATHERINE DEFILIPPO, ECONOMIST
CHAND MEHTA, AUDITOR/ACCOUNTANT
JACK GREENBLATT, COMMODITY-INDUSTRY ANALYST

APPEARANCES: (cont'd.)

In Support of the Imposition of Antidumping Duties:

On behalf of Globe Metallurgical, Inc.; SIMCALA, Inc.; International Union of Electronic, Electrical, Salaried, Machine and Furniture Workers (I.U.E-C.W.A., AFL-CIO, C.L.C., Local 693; Paper, Allied-Industrial Chemical and Energy Workers International Union (Local 5-89); and United Steelworkers of America (AFL-CIO, Local 9436):

J. MARLIN PERKINS, Vice-President Sales North America, Globe Metallurgical, Inc.
C. EDWARD BOARDWINE, President and CEO, SIMCALA, Inc.
KENNETH R. BUTTON, Economic Consulting Services, Inc.
PETER J. KIMBALL, Economic Consulting Services, Inc.

WILLIAM D. KRAMER, Esquire
JESSIE M. BROOKS, Esquire
Verner, Liipfert, Bernard, McPherson & Hand
Washington, D.C.

In Opposition to the Imposition of Antidumping Duties:

On behalf of SUAL Holding; ZAO Kremny; Pultwen, Ltd.; and Greenwich Metals, Inc.:

PETER J. APPLEBY, President, Greenwich Metals, Inc.
DR. PATRICK J. MAGRATH, Managing Director, Georgetown Economic Services
BRAD HUDGENS, Economic Consultant, Georgetown Economic Services

FREDERICK P. WAITE, Esquire
KIMBERLY R. YOUNG, Esquire
Holland & Knight, LLP
Washington, D.C.

APPEARANCES: (cont'd.)

On behalf of Bratsk Aluminum Smelter:

THOMAS B. WILNER, Esquire
JEFFREY M. WINTON, Esquire
QUENTIN M. BAIRD, Esquire
Shearman & Sterling
Washington, D.C.

On behalf of General Electric Silicones, LLC:

MARCIA HAYNES, General Manager, Global Sourcing,
GE Silicones
BRENT L. BARTLETT, Economist, Dewey Ballantine

MICHAEL H. STEIN, Esquire
Dewey Ballantine, LLP
Washington, D.C.

P R O C E E D I N G S

(9:30 a.m.)

MR. FEATHERSTONE: Good morning. Welcome to the United States International Trade Commission's conference in connection with the preliminary phase of antidumping investigation No. 701-TA-991 concerning silicon metal from Russia.

My name is Lynn Featherstone. I'm the Commission's Director of Investigations, and I'll preside at this conference. Among those present from the Commission staff are Bonnie Noreen, the supervisory investigator; Fred Fischer, the investigator; Irene Chen, the attorney/advisor; Cathy DeFilippo, the supervisory economist, whose economist is next door; Chand Mehta, the auditor and financial analyst; and Jack Greenblatt, the industry analyst.

The purpose of this conference is to allow you to present to the Commission through the staff your views with respect to the subject matter of the investigation in order to assist the Commission in determining whether there is a reasonable indication that an industry in the United States is materially injured or threatened with material injury or that the establishment of an industry in the United States is materially retarded by reason of imports of the merchandise which is the subject of the investigation.

Individuals speaking in support of and in

Heritage Reporting Corporation
(202) 628-4888

1 opposition to the petition have each been allocated one hour
2 to present their views. Those in support of the petition
3 will speak first.

4 The chair may ask questions of speakers either
5 during or after your statements. However, no cross-
6 examination by parties or questions to opposing speakers
7 will be permitted. At the conclusion of the statements from
8 both sides, each side will be given ten minutes to rebut any
9 opposing statements, suggest issues on which the Commission
10 should focus in analyzing data received during the course of
11 the investigation and make concluding remarks.

12 This conference is being transcribed, and the
13 transcript will be placed in the public record of the
14 investigation. Accordingly, speakers are reminded not to
15 refer in your remarks to business proprietary information
16 and to speak directly into the microphones. Copies of the
17 transcript may be ordered by filling out a form which is
18 available from the stenographer.

19 You may submit documents or exhibits during the
20 course of your presentations. However, we will not accept
21 materials tendered as business proprietary. All information
22 for which such treatment is requested must be submitted to
23 the Secretary in accordance with Commission Rule 201.6.

24 Any documents that are letter size and copiable
25 will be accepted as conference exhibits and incorporated

1 into the record of the investigation as an attachment to the
2 transcript. Other documents that you would like
3 incorporated into the record of the investigation must be
4 submitted with your post-conference briefs.

5 Speakers will not be sworn in. However, you are
6 reminded of the applicability of 18 USC 1001 to false or
7 misleading statements and to the fact that the record of
8 this proceeding may be subject to court review if there is
9 an appeal. Finally, we ask that you state your names and
10 affiliation for the record before beginning your
11 presentations.

12 Are there any questions? If not, welcome Mr.
13 Kramer. Please proceed.

14 MR. KRAMER: Good morning. I am Bill Kramer of
15 Verner, Liipfert, Bernard, McPherson & Hand, counsel for
16 Petitioners. To my left is Marlin Perkins of Globe
17 Metallurgical, vice-president of Sales. To Marlin's left is
18 Jessie Brooks of Verner Liipfert, and to her left is Peter
19 Kimball of Economic Consulting Services. To my right is Ed
20 Boardwine, president of SIMCALA, and to his right is Ken
21 Button of Economic Consulting Services.

22 In this preliminary investigation, the evidence
23 unequivocally demonstrates that there is a reasonable
24 indication of material injury to the U.S. silicon metal
25 industry by reason of imports from the Russian Federation.

1 The Commission already knows a great deal about
2 silicon metal, the nature of the U.S. silicon metal market
3 and the domestic industry through its previous antidumping
4 investigations and its recent sunset reviews of the existing
5 antidumping duty orders. Many elements of Petitioners' case
6 have already been examined and established in the context of
7 the prior investigations and sunset reviews.

8 Among other things, the Commission has found that
9 all silicon metal constitutes a single like product and that
10 the U.S. silicon metal market is price sensitive. In the
11 sunset reviews, the Commission also found that the domestic
12 industry was vulnerable to material injury by reason of
13 dumped imports. Nevertheless, we intend to cover all of the
14 key elements of our case today to complete the record and
15 for the benefit of those members of the staff who were not
16 involved in the previous proceedings.

17 This case is really very simple. Silicon metal is
18 a commodity product. Purchasers select suppliers
19 principally on the basis of price. Over the past three
20 years, silicon metal imports from Russia have been entering
21 the U.S. market in significant and increasing volumes and at
22 aggressively low prices.

23 Particularly in the past year, the volume of these
24 imports has surged, capturing a substantial and increasing
25 share of the market at a time when both U.S. consumption and

1 the domestic industry sales volume and market share have
2 declined. The imports have undercut the domestic industry
3 in both the metallurgical and chemical producer segments of
4 the U.S. market. In fact, the Russian imports have undercut
5 the domestic industry's prices to such an extent that
6 current pricing is at levels below U.S. producers' cost of
7 production.

8 As is evident from the producers' questionnaires,
9 the unfairly traded Russian imports have caused the U.S.
10 industry to suffer deteriorating performance with respect to
11 essentially every one of the Commission's traditional injury
12 indicia. The industry's loss of sales volume and revenues
13 has resulted in declines in capacity, production, shipments,
14 market share, employment and financial performance.

15 One domestic producer was forced to permanently
16 exit the silicon metal business during the period of the
17 Commission's investigation. Other U.S. producers have
18 suffered such severe financial deterioration that they have
19 had to shut down furnaces, shift furnace operations to other
20 products or cancel expansion plans. Overall, the data make
21 it abundantly clear that the unfairly traded imports from
22 Russia have had a severe negative impact on the domestic
23 industry.

24 As the Globe and SIMCALA witnesses here today will
25 testify, the U.S. industry is being severely hurt by these

1 low-priced, dumped imports. Without relief from these
2 imports, there is no prospect of any price recovery or an
3 end to the severe damage now being done to the domestic
4 industry.

5 Our first witness is Marlin Perkins of Globe.

6 MR. PERKINS: Good morning. My name is Marlin
7 Perkins. I'm the vice-president of Sales at Globe
8 Metallurgical, Inc., a position I have held for the past 12
9 years. I supervise the selling and marketing of Globe's
10 entire product line, including silicon metal. Globe is the
11 second largest U.S. silicon metal producer with plants in
12 four locations -- Selma, Alabama; Niagara Falls, New York;
13 Springfield, Oregon; and Beverly, Ohio.

14 I am here today to testify about the
15 characteristics and uses of silicon metal, the nature of the
16 domestic silicon metal market and the negative impact of the
17 dumped imports from Russia on the domestic silicon metal
18 industry in general and on Globe specifically. Let me tell
19 you; these effects have been catastrophic.

20 Silicon metal is a product composed almost
21 entirely of elemental silicon with minor amounts of
22 impurities such as iron, calcium and aluminum. Most silicon
23 metal is purchased by two groups of customers, chemical
24 manufacturers and primary and secondary aluminum producers.
25 In the chemical sector, silicon metal is used to produce a

1 precursor to silicon chemicals. Aluminum producers use
2 silicon metal in the production of aluminum alloys.

3 There is no meaningful difference between
4 domestically produced and imported silicon metal. Competing
5 suppliers produce essentially the same product using the
6 same raw materials and the same production process. They
7 sell it on the same basis and to the same customers.

8 Historically, the Russians produce a lower purity
9 product suitable principally for the metallurgical industry
10 customers. In recent years, however, the Russian producers
11 have improved the quality of their product. Imported
12 Russian silicon metal, like the domestic product, now meets
13 customer specifications in all segments of the U.S. market,
14 and Russians are aggressively targeting the entire market,
15 including the chemical industry customers.

16 A large portion of the total U.S. silicon metal
17 consumption is concentrated in the hands of a few major
18 chemical and aluminum industry purchasers. Because of the
19 many competing sources of silicon metal supply and the large
20 size and small number of these major purchasers, our most
21 important customers have a great deal of leverage in price
22 negotiations.

23 These customers are in a position to and do use
24 competing domestic and import prices in order to force the
25 prices down to the lowest levels possible. Recently, a

1 number of these customers have been making intensified
2 efforts to obtain low-priced import sources of supply or to
3 use import prices to drive down domestic producer prices.

4 The bottom line is that for silicon metal
5 consumers, the most important consideration in making
6 purchasing decisions by far is price. In the marketplace
7 you can talk to customers about sales and technical service,
8 about quality and quality control and do a number of things
9 attempting to differentiate your product from the
10 competition, but what the customer always comes back to is
11 price. How much per pound?

12 The extent to which the market is purely price
13 based is illustrated by a recent change in silicon metal
14 marketing; the advent of internet auctions. While we are
15 not concerned about the auctions per se, indeed we realize
16 that they may be the wave of the future. We are concerned
17 with the effect of dumped imports on these auction
18 processes.

19 In the past, when companies were requesting price
20 quotations for contract sales there was some negotiating
21 room. Prices were quoted either through verbal discussions
22 or by means of sealed bids. This provided some degree of
23 confidentiality and comfort in knowing that your price
24 quotes or bids would not be widely broadcast and used to
25 drive prices down further. Special prices could be

1 negotiated when necessary to obtain some needed business or
2 to reward a loyal customer.

3 All of this changed in recent on-line auctions
4 held by two major silicon metal consumers. In one auction,
5 the purchaser published a list of product specifications and
6 contract demands ahead of time. Bidders had to agree to the
7 purchaser's terms up front in order to be allowed to bid.
8 Once the auctions were underway, every bidder was able to
9 see the pricing fall on a minute by minute basis. As a
10 producer, it was troubling, to say the least, to watch
11 prices tumble rapidly. In auctions, I personally watched as
12 prices fell instantaneously after each new bid was entered.

13 It became obvious very quickly that certain
14 bidders, including the Russians, were intent on capturing
15 the auction business regardless of the price. As a result
16 of the aggressive pricing, imports from Russia are surging
17 into the U.S. market at a time when the domestic industry is
18 the most vulnerable. Although Russian imports have had a
19 significant presence in the U.S. market throughout the
20 Commission's period of investigation, they sharply escalated
21 in 2001.

22 The volume of Russian imports has been
23 accelerating when both prices and demand have been declining
24 and when other suppliers are cutting back on production.
25 Worse yet, our customers have told us that they have been

1 assured that before any antidumping orders can take effect,
2 enough Russian material will be brought in to satisfy the
3 requirements for the remainder of this calendar year. The
4 Russian imports fight aggressively for market share wherever
5 they appear, and every time Russian silicon metal wins a
6 sale by cutting price the domestic industry is hurt because
7 all prices are affected rapidly.

8 A substantial portion of silicon metal sales are
9 made under long-term contracts covering a period of at least
10 one year. However, these contracts do not protect domestic
11 products from import competition. For example, in the case
12 of Globe the price in long-term contracts is a negotiated
13 term that reflects competition at the time when the contract
14 is written. Then when prices fall, the large silicon metal
15 customers simply pressure us to reduce the contract prices
16 or risk losing future business.

17 The current market situation has left the domestic
18 industry reeling. Today, silicon metal prices are severely
19 depressed. Published prices have fallen from almost 87
20 cents a pound in 1997 to as low as 49 cents a pound today.
21 In fact, prices are now approaching and possibly are already
22 below the cash cost of producing silicon metal for most, if
23 not all, U.S. producers.

24 All U.S. producers, including Globe, are being
25 directly impacted by the low-priced Russian imports. I know

1 this from firsthand experience. In November, 2001, Globe
2 quoted a price of 53 to 54 cents per pound to a major
3 aluminum producer and a long-time customer. This customer,
4 which had purchased 3,000 to 4,000 tons of silicon metal
5 from Globe the previous year at a price of 56 cents per
6 pound, was very enthusiastic about the level of customer
7 contact, product quality and technical support provided by
8 Globe. In fact, we anticipated that Globe's participation
9 at this customer would increase.

10 Nevertheless, when the Russians came in with a bid
11 of 48 cents per pound it blew us right out of the water.
12 There was simply no possible way that Globe could compete at
13 that price level, and we lost all of the business to the
14 Russians.

15 As the Commission can see from the detailed data
16 that we provided in our questionnaire, Globe is currently
17 struggling to survive the impact of the surge in Russian
18 imports. Globe already has been forced to implement several
19 furnace reconfigurations, curtailments and plant closings
20 since January 1, 1999. The mounting imports, falling demand
21 and power shortages during the period have negatively
22 impacted each of Globe's four plants.

23 Due to the power crisis, Globe's one furnace plant
24 in Springfield, Oregon, was idled in December of 2000 and
25 has remained closed. Precisely and more importantly, if

1 this plant resumes operations it will be dictated by the
2 customers' market conditions.

3 In Selma, Alabama, power rate increases at a time
4 of increasing imports and decreasing demand forced Globe to
5 idle its plant during the months of July and August, 2001,
6 in exchange for a rate reduction for the balance of the
7 year. The major reason Globe was willing to accept this
8 agreement was the oversupply of silicon metal in the
9 domestic market. In fact, one furnace at the facility had
10 been idled early during June of 2001 strictly to control
11 finished product inventory levels.

12 Falling demand and rising imports also forced
13 Globe to convert one of the two silicon metal furnaces at
14 its Niagara Falls, New York, plant to the production of
15 ferrosilicon in August, 2001. When market conditions did
16 not improve by year end, both the ferrosilicon furnace and
17 the remaining silicon metal furnace at Niagara had to be
18 idled.

19 Finally, due to market conditions during calendar
20 year 2000 both of the silicon metal furnaces at Globe's
21 Beverly, Ohio, plant were converted to the production of
22 ferrosilicon for use as a foundry alloy feedstock. This
23 major restructuring also forced Globe to eliminate about 90
24 jobs permanently and lay off 67 other people at least
25 temporarily.

1 In these circumstances, it is easy to see that if
2 the domestic industry does not obtain relief from the dumped
3 Russian imports, Globe's very existence is seriously
4 threatened. Unless the domestic industry is afforded
5 relief, unfairly low-priced imports from Russia will
6 continue to flood the U.S. market at price levels that would
7 drive U.S. prices down below their currently depressed
8 levels.

9 The large amount of unused production capacity in
10 Russia and the fact that its silicon metal industry is
11 heavily export oriented demonstrates that increasing amounts
12 of subject imports are likely to enter the U.S. market. As
13 a result, the investments Globe and other U.S. silicon metal
14 producers have made to improve and expand their production
15 facilities and reduce production costs will be negated.
16 Further investment in plant and equipment as currently
17 planned will be halted or curtailed. More workers will be
18 laid off, and research and develop efforts will be postponed
19 or foregone entirely.

20 In fact, if the current situation is not
21 alleviated Globe may well have to cease silicon metal
22 production completely. Thank you.

23 MR. KRAMER: Our next witness is Mr. Boardwine.

24 MR. BOARDWINE: Good morning. My name is Ed
25 Boardwine. I'm the president and chief executive officer of

1 SIMCALA, which is located in Mt. Meigs, Alabama.

2 I've worked in the silicon metal industry for more
3 than 30 years. During that time, I've been involved in all
4 aspects of the business from engineering to production to
5 marketing to senior management. I've held my current
6 position for the last seven years. My company has never
7 appeared before the Commission. For that reason, I'd like
8 to give you some background about SIMCALA.

9 In 1995, a venture capital group, including
10 myself, formed SIMCALA to purchase the assets of SIMETCO, a
11 domestic silicon metal producer that was in bankruptcy.
12 After the acquisition, SIMCALA invested nearly three years
13 and approximately \$20 million in upgrading and modernizing
14 the former facility in order to produce high quality silicon
15 metal. Through these efforts, SIMCALA became an efficient
16 producer, able to provide a reliable supply of product to
17 the domestic customers at a competitive price. Indeed, we
18 believe that in terms of smelting efficiency SIMCALA is
19 among the most efficient producers globally.

20 In view of the healthy market conditions that
21 existed in 1998 and our successful efforts to upgrade the
22 company's facility, SIMCALA planned to expand further by
23 building a fourth furnace. Unfortunately, these expansion
24 plans remain on indefinite hold.

25 Over the past three years, conditions in the

1 United States silicon metal market have deteriorated
2 significantly. The deterioration accelerated in 2001 as
3 market prices were led downward by low-priced Russian
4 silicon material.

5 In addition to feeling the impact of declining
6 prices, we've been hit with significant losses of sales
7 volume. Combined, these efforts have forced us to scale
8 back our operations considerably. Instead of constructing a
9 fourth furnace as we had planned, SIMCALA was forced last
10 year to shutter one of its three existing furnaces. All of
11 these developments have had a dramatic effect on the
12 company's bottom line. In this capital intensive industry,
13 SIMCALA has sustained significant financial losses.

14 I would like to emphasize that silicon is
15 SIMCALA's only production product. We have no other product
16 lines to cushion the blow when prices in the silicon metal
17 market are driven down to below cost levels. Faced with
18 increasing flow of dumped Russian imports into the U.S.
19 market, our company is fighting now for its very survival.

20 Reviewing the detailed data that we provided in
21 our questionnaire will allow you to understand more fully
22 the problems confronting SIMCALA. During my presentation, I
23 will only highlight some of the negative effects that
24 SIMCALA has experienced as a result of unfairly traded
25 Russian imports.

1 As Marlin Perkins has explained, silicon metal is
2 a commodity product. There is little, if any, difference
3 between domestically produced and imported Russian silicon
4 metal. Customers can buy from numerous sources of supply --
5 domestic producers, foreign producers and traders. As a
6 result, price is usually the determining factor in a
7 customer's purchase decision.

8 There are various public sources of information on
9 silicon metal market prices such as *Metals Week* and *Ryan's*
10 *Notes*. These published prices are widely used as a
11 reference price throughout the entire market. Prices that
12 change are quickly communicated and affect all segments of
13 the market. As Marlin discussed, because there are many
14 competing sources of silicon metal supply and a very small
15 number of major customers in the United States, our
16 principal customers have a great deal of leverage in price
17 negotiations.

18 In mid 1998 when our company was completing the
19 first phase of expansion, the market prices reported in
20 *Metals Week* had been steady at about 72 cents a pound of
21 silicon metal. Over the period from 1999 through 2001,
22 significant volumes of low-priced Russian silicon metal made
23 their presence felt in the U.S. market, and prices
24 deteriorated. In 2001, as demand fell off and the domestic
25 industry was most vulnerable to injury, increasing volumes

1 of unfairly traded Russian material began to flow into all
2 segments of the U.S. market.

3 From a price of about 72 cents a pound in 1998,
4 silicon metals prices plummeted to about 50 cents a pound by
5 the fourth quarter of 2001. This represents a decline of
6 more than 30 percent. As industry publications have
7 reported, the low-priced silicon from Russian imports have
8 led the price down in the U.S. market. Currently, pricing
9 is approaching and in most cases is below our cash cost of
10 producing silicon metal.

11 As with other domestic silicon metal producers, we
12 often enter into long-term contracts with our major
13 customers. These contracts are renewable at the end of the
14 term and often contain pricing mechanisms based on prices in
15 *Ryan's Notes* and other trade publications. Those long-term
16 contracts, therefore, do not insulate us from market price
17 fluctuations. Volume is set in a range, and the price is
18 actually adjusted typically quarterly or annually on the
19 basis of a published price market trend.

20 Last year, when we submitted a new multi-year
21 purchase contract to one of our largest, most longstanding
22 and most reliable customers, the customer requested a
23 starting price that was below our cash cost of production.
24 The customer informed us that the *Ryan's Notes* price, which
25 was depressed by dumped Russian silicon metal, justified the

1 request. Because we could not agree to a multi-year
2 contract at a loss, we found it necessary to agree to enter
3 into a short-term contract for a much lower volume at the
4 below cost price just to maintain our valuable relationship
5 with this customer.

6 Even where we have maintained sales volume we have
7 suffered lost revenue. For example, for several years
8 SIMCALA has been the sole supplier to one of our silicon
9 metal customers. In October of last year, SIMCALA submitted
10 a price quote to this customer that we believed was fair and
11 competitive. The customer informed us that it had received
12 a competing price quote from a supplier of Russian silicon
13 metal that was approximately ten cents lower than our quote.
14 In order to maintain our longstanding relationship with the
15 customer, we submitted a new quote that was significantly
16 lower than our original price.

17 Depressed prices and our loss of sales volume have
18 had several serious repercussions for our company. SIMCALA
19 has been able to forego its projected expansion. As I
20 mentioned earlier, in light of the favorable market
21 conditions that prevailed in 1998, the company planned to
22 construct a fourth furnace during the period from 1999 to
23 2000. Once operational, this furnace would have increased
24 SIMCALA's capacity by 33 percent. The furnace would have
25 added 30 full-time jobs.

1 Instead of implementing these expansion plans, the
2 company contracted in 2001. We were forced to close one of
3 our three existing furnaces, actually reducing SIMCALA's
4 capacity by 33 percent. We were also forced to reduce our
5 work force by half. In 2001, we lost 50 hourly workers and
6 ten salaried employees.

7 Under the weight of the depressed market prices
8 and our lost sales and capacity, SIMCALA has experienced
9 major financial losses. In 1999, the company suffered a net
10 loss of \$3.9 million, and in 2000 we suffered a net loss of
11 \$5.8 million. In 2001, SIMCALA had additional losses and
12 also found it necessary to take a \$62 million charge related
13 to the impairment of long-lived assets. The charge included
14 a write down of goodwill and a write down of property, plant
15 and equipment. Revaluing the assets of the company in this
16 way was necessary because deteriorating market conditions,
17 fueled by Russian silicon metal imports, made the company's
18 financial situation so precarious.

19 The company has also not been able to meet its
20 debt service requirements. On October 15, 2001, SIMCALA was
21 not able to make an interest payment due on \$75 million in
22 bondholder notes. Because the company's only available
23 credit facility has been suspended, it was necessary for us
24 to enter into negotiations with the holders of the notes in
25 order to restructure our debt.

1 The deteriorating market conditions driven by
2 unfair Russian imports have also had a significant effect on
3 SIMCALA's credit rating. In 1998, Moody's assigned SIMCALA
4 a B-2 issuer credit rating. In April of the following year,
5 the service downgraded our credit rating to CAA-1. Last
6 year, Moody's downgraded the company's credit rating again,
7 this time to junk, and just last week we received word from
8 Moody's that they would no longer even track SIMCALA's debt
9 rating.

10 In summary, the situation we at SIMCALA face is
11 dire. Led downward by unfairly priced Russian material,
12 domestic market prices have plummeted. We've lost
13 significant business from even our oldest customers, and our
14 company has suffered devastating financial losses.

15 If the Commission does not afford us the relief
16 that we seek, the rising flow of dumped Russian silicon
17 metal into the U.S. market will destroy our viability and
18 indeed the viability of the entire domestic industry.

19 Thank you.

20 MR. KRAMER: Our next witness is Dr. Ken Button.

21 MR. BUTTON: Good morning. I'm Kenneth Button,
22 senior vice-president of Economic Consulting Services, Inc.
23 I'm appearing today at this staff conference on behalf of
24 the domestic industry to assess the economic evidence as to
25 whether the U.S. silicon metal industry is injured or

1 threatened with injury by reason of imports from Russia.

2 I have provided for the staff's convenience a set
3 of exhibits based on public information, which I will
4 reference in my testimony. I ask that the exhibits be
5 accepted for inclusion in the record.

6 I would begin by noting the conditions of
7 competition that are distinctive to the silicon metal
8 industry. First, silicon metal is a commodity product.
9 While the product purchased by a customer may need to
10 conform to that customer's particular specifications, the
11 differences in specifications among buyers in the consuming
12 chemical and metallurgical industries tend to be relatively
13 minor and can be met by virtually all domestic and import
14 suppliers.

15 Second, it's important to appreciate that
16 virtually all silicon metal from essentially all suppliers
17 is very pure, usually around 99 percent silicon, with the
18 remainder being very minor amounts of impurities. Although
19 silicon metal has been described in terms of different
20 grades, for example chemical grade or metallurgical grade,
21 there is in fact no accepted grade classification system.

22 Grades actually refer to ranges of specifications
23 that are typically sold to particular customer segments
24 specifying minimum levels of silicon and maximum amounts of
25 these impurities. Domestic and imported silicon metal of

1 the same so-called grade are completely interchangeable
2 regardless of producer source.

3 Producers make the highest purity silicon metal
4 that they can. No one intentionally produces a lower purity
5 product that can only meet the customer specifications in,
6 for example, the secondary aluminum sector. Therefore,
7 silicon metal suitable for the chemical sector, so-called
8 higher grade material, is routinely sold down to primary and
9 secondary aluminum producer customers.

10 Third, given its commodity product nature and the
11 interchangeability of Russian and domestic silicon metal,
12 competition among silicon metal producers is fundamentally
13 based on price, and relatively small differences in price
14 can lead consumers to switch some or all of their purchase
15 volumes to other suppliers.

16 Information about prevailing prices is available
17 on a weekly basis in industry publications such as *Platt's*
18 *Metals Week* and *Ryan's Notes*. Furthermore, purchasers tend
19 to be willing to reveal to competing suppliers the prices at
20 which silicon metal is being offered by other suppliers.
21 The combined effect of these market practices is to insure
22 that price changes are quickly communicated throughout the
23 market. In fact, a variety of price adjustment mechanisms
24 are used in long-term contracts which contribute to keeping
25 supplier prices relatively aligned.

1 For example, frequently such contracts require
2 that contract transaction prices be based on formulas tied
3 to the reference prices in such sources as *Metals Week* and
4 *Ryan's Notes*. The use of index pricing, meet or release
5 clauses and other price adjustment mechanisms means that
6 long-term contracts provide little shelter from import price
7 competition and make the supplier vulnerable to the effects
8 of an overall declining market price level.

9 Moreover, as these two price indices are based in
10 significant measure directly on import prices for Russian
11 silicon metal, the low prices of imports from Russia have a
12 direct negative effect on U.S. producer revenues even with
13 those customers not receiving bids directly from the Russian
14 material suppliers.

15 Moreover, even with long-term, supposedly fixed
16 price contracts in the chemical and primary aluminum
17 sectors, the attractiveness of low-priced imports can be
18 irresistible to customers themselves subject to intense
19 competitive pressures. Some of these customers have simply
20 given U.S. producers ultimatums. Either you must cut your
21 price, or we are switching our volume to lower priced
22 suppliers. Realistically, U.S. producers have little choice
23 but to comply.

24 Recently there has been a significant new
25 development in how silicon metal is purchased. As you have

1 heard from the industry witnesses, a major purchaser has
2 begun using an internet auction procedure under which, one,
3 all suppliers are pre-qualified, thus removing quality
4 differences as a possible differentiating factor; two, bid
5 prices are instantaneously communicated among all competing
6 suppliers; and, three, price becomes literally the only
7 determining factor in the customer's final purchase
8 decision. This is an important new condition of competition
9 in the market that makes it easier for low-priced imports
10 rapidly to take market share away from domestic producers
11 and to force down the domestic price level.

12 Fourth, Russian silicon metal competes in all
13 customer segments of the U.S. market. In the first silicon
14 metal investigation in 1991, Respondents from Argentina,
15 Brazil and China claimed that their products were unsuitable
16 for chemical customer use such that the U.S. producers'
17 sales to chemical customers were sheltered from import
18 competition. As the Commission concluded then and
19 reaffirmed in the sunset review, that claim is false.

20 The clarity of the situation is even more evident
21 today. No segment of the U.S. market is insulated from
22 import competition. Imports from Russia are sold to
23 chemical customers in large volume, direct, head-to-head
24 competition with U.S. product just as these imports compete
25 with U.S. product and sales to primary and secondary

1 aluminum customers.

2 Indeed, Russian producers have worked to improve
3 their product quality over time and have intensified their
4 focus on the chemical and primary aluminum customer segments
5 of the market in the United States and elsewhere. As a
6 result, the degree of competition between the domestic
7 producers and imports from Russia is more direct than ever.

8 The interplay of these competitive forces means
9 the prices in different segments of the U.S. silicon market
10 are highly interrelated. For example, although the absolute
11 levels of prices of materials sold to chemical customers are
12 generally higher than the prices of sales to secondary
13 aluminum customers and may change somewhat less rapidly
14 because of the chemical sector's use of longer term
15 contracts, the trends in chemical and secondary aluminum
16 segment prices are in fact highly correlated over time.

17 One reason is that on the supply side U.S.
18 producers and major import suppliers such as the Russian
19 producers simultaneously sell into all three segments.
20 Furthermore, on the demand side some metallurgical customers
21 that operate both primary and secondary aluminum production
22 facilities simultaneously buy silicon metal for their use in
23 these two segments. Prices to customers in all segments
24 are, therefore, subject to constant adjustment, balancing
25 one against the other, and subject to the interplay of

1 industry wide supply and demand forces.

2 As demonstrated by the petition and the U.S.
3 producers' questionnaire data, essentially all of the
4 domestic industry's performance indicia demonstrate that it
5 is suffering current material injury. These indicia are
6 listed in our Exhibit No. 1, as shown on the screen and in
7 the handout before you. As the detailed data are
8 confidential, I can only note general trends in this public
9 forum.

10 First, the domestic industry's production capacity
11 fell greatly over the 1999-2001 period. The decline
12 resulted from the closure of American Silicon Technologies
13 in 1999 and the subsequent decline in the capacity of other
14 U.S. producers.

15 Production has fallen substantially. As shown in
16 Exhibit 2, SIMCALA has closed one of its three furnaces, and
17 Globe has shut down or converted four of its furnaces,
18 removing a very substantial volume of production from the
19 market and leaving only Globe's furnaces at Selma, Alabama,
20 still operating. Even with a drop in U.S. capacity, the
21 domestic industry's production drop was so great that the
22 industry's capacity utilization rate has fallen as well.

23 With American Silicon Technologies ceasing
24 production and the decline in the domestic production of
25 other producers, industry employment fell significantly

1 during the POI. As with production, U.S. shipments dropped.
2 There was certainly some contraction in U.S. demand during
3 the POI, particularly in 2001, but, as the U.S. industry
4 shipment volume fell at a faster rate than did U.S. apparent
5 consumption, the industry's market share declined
6 substantially.

7 Reflecting the market deterioration, domestic
8 producers' prices have declined significantly during the
9 POI. Both the average unit values of shipments and the
10 quarterly transaction prices of the U.S. producers fell
11 considerably. The price declines were clearly evident in
12 all three customer segments of the market.

13 The financial performance of the domestic industry
14 declined under the combined weight of reduced sales volume
15 and lower prices. The industry's operating income fell
16 sharply during the POI, as did its cash flow.

17 As Mr. Boardwine has described, SIMCALA is
18 suffering very large losses, has been forced to write down
19 the value of its assets and cannot service its debt. Mr.
20 Perkins has described Globe's financial deterioration as
21 well. In the face of such financial pressures, the industry
22 has been forced to reduce capital expenditures and to scale
23 back planned new investment projects.

24 The data are clear that the rising volume of
25 dumped imports of silicon metal from Russia is the cause of

1 the domestic industry's injury. The volume of imports from
2 Russia is clearly significant and rising, as shown in our
3 Exhibit No. 3. From about 25,700 short tons in 1999,
4 imports from Russia increased by 42 percent to 36,500 short
5 tons in 2001 and now account for 28 percent of total imports
6 in a rising and substantial U.S. market share. The increase
7 in imports from Russia during 2001 was extraordinary, as
8 shown in the exhibits. The volume in the fourth quarter of
9 2001 alone reached 13,700 short tons.

10 The prices of the imports from Russia have
11 remained very low during the POI and have exerted a serious
12 depressing and suppressing effect on the U.S. industry
13 prices. Not only have the Russian import prices been very
14 low; there has also been a shift in the composition of the
15 Russian material from the low content HTS category toward
16 the higher silicon content HTS category. However, it
17 appears that the Russia producers are selling at least some
18 of their higher purity material at the same very low prices
19 as the lower purity material.

20 Overall, even considering the fact that the
21 Russian import average unit values do not include inland
22 freight and importer marketing, it is evident that the
23 Russian transaction prices are consistently underselling
24 U.S. producers. The expanding volume of the low-priced
25 Russian material has been entering during a period of weak

1 aggregate U.S. demand, which has made the U.S. industry
2 especially vulnerable to the injurious impact of these
3 imports. While weakened U.S. demand during 2001 has had a
4 negative price effect, the presence of the increasing volume
5 of the very low-priced Russian material forced U.S.
6 producers to cut prices substantially more than they
7 otherwise would have.

8 In Exhibit 4, we see that the Russian volumes and
9 prices are strongly, but negatively, correlated. In other
10 words, as you can see from the right-hand side of the
11 exhibit, the rising Russian import volume is associated with
12 declining Russian import prices.

13 Furthermore, as shown in our Exhibit 5, it appears
14 that especially during the Russian volume surge in 2001
15 imports from Russia have led the *Metals Week* price downward.
16 The result for the domestic industry has been lost sales and
17 revenue.

18 The petition details several instances of the
19 head-to-head competition between the U.S. producers and
20 imports of Russian material which have resulted in lost
21 sales volume for the U.S. industry and have consequently
22 caused the industry to lose production, employment, market
23 share and financial return. These lost sales have occurred
24 in all three customer segments of the market.

25 Similarly, in the face of the Russian competition

1 U.S. producers have been forced to cut price in order to
2 persuade customers not to switch all of their volume
3 requirements to Russian material. The price reductions have
4 been substantial.

5 Moreover, U.S. industry revenues have declined
6 still further, even with those customers that do not receive
7 direct bids from the suppliers of Russian material, because
8 of the common use of price benchmarks such as *Metals Week*
9 price, which have been depressed by the low Russian import
10 prices, especially during 2001. The result overall today is
11 a U.S. industry in crisis with some members literally
12 fighting for survival.

13 The Russian producers have made clear that their
14 competitive assault is going to intensity. As shown in
15 Exhibit 6, a *Metals Week* report on March 20, 2002, quotes a
16 source close to a Russian producer as saying, "We are
17 currently shipping as much silicon to the U.S. as we can
18 because of the threat of U.S. trade tariffs."

19 This is fairly stark evidence of a threat of
20 imminent further injury to the domestic industry. The
21 Russian producers clearly have the capacity to expand their
22 exports to the United States and intentionally are going to
23 stockpile an inventory in the United States which can only
24 further depress U.S. prices.

25 The Russian plants have significant current unused

1 capacity, and all three of the producers reportedly have
2 additional capacity planned. Moreover, as the Russian
3 producers are already heavily export oriented, they can
4 switch exports rapidly from current third country
5 destinations towards the United States.

6 Also, there are a number of other Russian ferro
7 alloy producers which could easily switch furnaces from the
8 production of ferrosilicon toward production of additional
9 silicon metal. The fact that an expanded Russian volume of
10 silicon metal can rapidly penetrate the U.S. market and
11 further reduce U.S. prices has already been amply
12 demonstrated by the Russian materials' rapid import and
13 market share expansion in 2001 and the resulting price
14 depression.

15 In conclusion, the evidence is clear that the
16 rising volume of low-priced imports from Russia has severely
17 injured the domestic industry and threatens to cause greater
18 injury still.

19 Thank you.

20 MR. KRAMER: That concludes our presentation. We
21 would be happy to respond to questions from the staff.

22 MR. FEATHERSTONE: Thank you, Mr. Kramer and to
23 all the witnesses, for your presentations. We will accept
24 the collection of six exhibits that Dr. Button had as
25 Collective Conference Exhibit 1.

1 Mr. Fischer?

2 MR. FISCHER: Fred Fischer, Office of
3 Investigations. Thank you for your testimony, all of you.
4 I just have a few brief questions.

5 This first one is to Mr. Button. What is the
6 typical price difference between metallurgical grade and
7 chemical grade silicon metal?

8 MR. BUTTON: Because my knowledge is very much
9 based on the questionnaire data, I'd be happy to provide
10 that in a --

11 MR. FISCHER: Sure.

12 MR. BUTTON: -- confidential response if I might,
13 please.

14 MR. FISCHER: Thank you.

15 Mr. Perkins and Mr. Button both identified on-line
16 silicon metal auctions I guess by two producers. If it's
17 possible in your post-conference brief to provide additional
18 information on those auctions, including the firms,
19 websites, contacts and an explanation of how the mechanism
20 works, that would be useful.

21 MR. KRAMER: We would be happy to do that.

22 MR. FISCHER: Thank you.

23 Mr. Button had put up an exhibit, I believe it was
24 Exhibit 2, identifying conversions of furnaces from
25 ferrosilicon to silicon metal. If you could provide in the

1 post-conference brief just an analysis of what is involved
2 in the conversion -- cost, time -- and just essentially put
3 dates and costs if possible added to Exhibit 2?

4 MR. BUTTON: Very good. The cost in the sense
5 meaning the cost to make the conversion to the new product?

6 MR. FISCHER: Correct.

7 MR. BUTTON: Is that what you had in mind?

8 MR. FISCHER: Correct. I mean, I guess for our
9 analysis we need to consider how easy it is to switch from
10 one product to another.

11 MR. BUTTON: Right. There may be different
12 application costs, depending on which way you switch.

13 MR. FISCHER: Well, if you could identify that as
14 well?

15 MR. BUTTON: I would be happy to comment on that
16 as well.

17 MR. FISCHER: Are environmental compliance costs a
18 significant cost of production?

19 MR. PERKINS: Yes, sir, they are. They are a
20 factor.

21 MR. FISCHER: If possible, in the post-conference
22 brief if you could just further elaborate on those costs?

23 MR. PERKINS: Yes, sir.

24 MR. FISCHER: Elkem, which is the largest U.S.
25 producer, is not a petitioner, and they're not an active

1 participant before us today. I'm just wondering what the
2 significance of that would be on the Commission's analysis,
3 if any?

4 MR. KRAMER: We think that the Commission should
5 base its analysis of Elkem's situation on the data provided,
6 and we think that Elkem, like other producers, is subject to
7 the same forces we've described. Elkem's union is a
8 Petitioner.

9 MR. FISCHER: Thank you. I have no further
10 questions at this time.

11 MR. FEATHERSTONE: Ms. Chen?

12 MS. CHEN: Thank you. Irene Chen from the Office
13 of General Counsel.

14 I just have a general question here about
15 conditions of competition. If Petitioners could please
16 further elaborate in your post-conference briefs as to which
17 conditions of competition you believe the Commission should
18 consider?

19 My next question concerns the decline in U.S.
20 shipments. In your petition you discuss the decline in your
21 shipments from 1999 to 2000. However, you then talk about
22 the surge in Russian imports into the U.S. market in 2001
23 causing U.S. shipments to fall even further.

24 Can you please address in your briefs or here
25 today why U.S. shipments already were declining from 1999 to

1 2000?

2 MR. BUTTON: We would be happy to get into that in
3 the briefs and provide you some details.

4 MS. CHEN: Okay. Thank you.

5 Are any of the silicon metal products produced by
6 the domestic producers used in their own manufacturing
7 operations to produce other products?

8 MR. KRAMER: No.

9 MS. CHEN: Turning to the commodity product
10 issues, do you have to qualify or certify your silicon metal
11 products prior to selling those products to your customers?
12 If so, can you please describe the qualification or
13 certification process?

14 MR. PERKINS: Yes, ma'am, there is a qualification
15 process, and it differs by not only the industry segment,
16 but by customers within the segment. It has been in the
17 past a much more involved, difficult process on the chemical
18 end and much lesser so on the secondary aluminum end.

19 I can tell you as the pricing differential has
20 fallen that that process seems to be much more compressed
21 today than it has in the past, and we could elaborate more
22 in a post-hearing brief.

23 MR. BOARDWINE: Ed Boardwine. Although there is a
24 qualification requirement for most major customers in the
25 United States, all the domestics and most of the imports

1 have already qualified.

2 MS. CHEN: Okay. Thank you.

3 MR. BUTTON: I would just like to add slightly to
4 that. As we discussed in the context of the auction, once
5 the suppliers have become qualified and you're able,
6 therefore, to remove quality and qualitative issues as a
7 differentiating factor among the suppliers then it really is
8 only price which determines who the purchaser is treating,
9 you know, the ultimate and the commodity product.

10 MS. CHEN: So is that qualification process
11 standardized across the board?

12 MR. BOARDWINE: No, ma'am, it's not standardized.
13 It's specific usually to the industry and to the customer
14 itself.

15 MS. CHEN: Do all domestic producers have the
16 capability or capacity to manufacture silicon metal products
17 that may be sold to primary and secondary aluminum
18 producers, as well as chemical producers?

19 MR. PERKINS: Yes, ma'am. We try to produce the
20 best product that we can produce every day, every hour,
21 every tap, so that if we can produce a product that can be
22 sold into the chemical industry we can always sell that
23 product down to the primary industry or the secondary
24 industry.

25 As we have seen over the last couple of years, the

1 Russian competition has the same philosophy. They are
2 selling to all the different segments of the industry.

3 MS. CHEN: Can you please further elaborate on the
4 business cycle of silicon metal or demand and supply,
5 meaning, for example, that steel follows a business cycle?

6 MR. BUTTON: For silicon metal, its demand follows
7 two separate industries, one the chemical industry and the
8 other those that produce and use aluminum alloys. Both of
9 them follow to a certain degree the overall macro economies
10 of cyclical trends, but each have slightly distinctive
11 trends.

12 In general, however, over this period it's my
13 understanding that the demand in the chemical sector for
14 silicon metal products has been rising, but rising at
15 different rates during the period of time. More recently it
16 has been a relatively flat rate of increase. On the other
17 hand, with respect to the aluminum sector, that has been
18 more classically cyclical as it reflected the overall macro
19 ups and downs of the economy.

20 Is that responsive?

21 MS. CHEN: Yes.

22 Turning to prices, in the petition you discuss
23 that prices of all silicon metal products are interrelated
24 in all market segments, and all prices key off the secondary
25 aluminum price. Do you mean that all prices ultimately

1 settle or converge at the secondary aluminum price?

2 MR. BUTTON: No, we do not. What we mean is that
3 the secondary aluminum price is the most widely known, most
4 transparent, most widely communicated price in the market.
5 It is in essence the *Metals Weeks* price and is watched as a
6 barometer, an indicator, by all members of the industry.
7 Since among suppliers they sell into all segments, they keep
8 that in mind, and the customers in all segments look at it.

9 As you've heard described by the industry
10 witnesses today, even in the purchases by chemical industry
11 buyers, they will use fluctuations in the *Metals Week* price
12 as justification for change in the price demands placed on
13 the U.S. producers.

14 MS. CHEN: Are there any other pricing differences
15 among sales of silicon metal to chemical versus aluminum
16 producers, any sort of --

17 MR. BUTTON: Well, I would just note that there
18 tends to be longer term contracts that are made use of in
19 the chemical sector, and then the shorter term arrangements
20 are made, for example, in the secondary aluminum segment.

21 I would let members of the industry comment
22 further.

23 MR. PERKINS: As Mr. Button pointed out, in the
24 secondary industry typically those are three month or a
25 quarterly running type agreement. Sometimes you see that on

1 a spot basis from truckload to truckload, but typically in
2 the secondary industry it's a quarterly price.

3 The primary industry is usually an annual price,
4 and the chemical industry is -- some of the manufacturers
5 are much longer term than one year, but maybe one year is
6 the standard issue.

7 MR. BUTTON: Ken Button. I would just add as a
8 follow up there seems to be something of a convergence in
9 industry practice, as you've heard in the testimony today.

10 The chemical sector contracts, although long term,
11 will set just a range in terms of volume such that if a
12 customer is dissatisfied with the pricing arrangement they
13 can go to the lower end of that volume.

14 Secondly, we have also heard that even within
15 long-term contacts there is the use of periodic price
16 indexing, be it quarterly or longer term, such that there is
17 hardly any insulation provided by that.

18 MR. KRAMER: I would just like to clarify one
19 point, which is there are a lot of different contractual
20 arrangements even within the chemical industry, and there
21 are a variety of different mechanisms used to cause the
22 price to reflect changes in market prices.

23 You know, some contracts are meet or release
24 provisions. Some are price indexed. Some have this
25 phenomenon of not having quantity or having a range of

1 quantity. There are a whole series of different kinds of
2 arrangements.

3 In some cases the producer, the chemical producer,
4 will simply come back during the term of a one year
5 agreement and say market conditions require you to lower
6 prices, so there's a lot of variety in the mechanisms, but
7 they all have some means by which market prices can
8 influence the price paid.

9 MS. CHEN: Thank you.

10 Are domestic producers able to satisfy silicon
11 metal demand, or is some level of imports necessary?

12 MR. BOARDWINE: Some level of imports are needed.

13 MS. CHEN: Would you like to address that further
14 in the brief as to how much?

15 MR. KRAMER: Sure. We'd be happy to do that.

16 MS. CHEN: Okay. Are inventories significant in
17 this industry, and have domestic producers' inventories
18 increased over the period of investigation?

19 Any one of you may respond. Are inventories
20 significant, and have inventories been increasing over the
21 period of investigation?

22 MR. BUTTON: Yes. We would be pleased to respond
23 in a confidential submission dealing with inventory overall.

24 MS. CHEN: You discuss in your petition that
25 industry production has decreased during the period of

1 investigation. In your petition, you mention that because
2 of the closure of AST's silicon metal production operations
3 U.S. capacity has decreased, which in turn has caused
4 production to climb. However, you also state that
5 production fell faster than capacity.

6 Are you saying that even without AST's closure the
7 domestic industry was suffering? Even taking AST's closure
8 out of the mix, was the industry suffering declines in
9 output?

10 MR. BUTTON: Yes.

11 MS. CHEN: In your petition, you mentioned that
12 SIMCALA shut down one of its furnaces in August, 2001, for
13 routine maintenance work. You also attach as an exhibit an
14 article from *The American Metal Market*, which quotes a
15 company executive from SIMCALA that, "The move to shut this
16 second furnace was not market related. Order books were
17 full for the year, and production was at full capacity."

18 However, later on in your petition you state that
19 in November, 2001, and also here in the conference that
20 SIMCALA had to shut down the furnace due to poor economic
21 conditions. Can you address the apparent inconsistency?

22 MR. BOARDWINE: Yes, ma'am. We took a furnace
23 down for annual maintenance. It was at the same time we
24 were renegotiating a new multi-year contract. As a result
25 of those negotiations, we had to take a lower volume at

1 below operating cost for that short-term agreement, and we
2 made a decision not to start the furnace back up.

3 MS. CHEN: Now, how is unused or idle capacity
4 being utilized? Is it being used to produce ferrosilicon?

5 MR. PERKINS: In Globe's case, we have started a
6 production of ferrosilicon items on the two large furnaces
7 that were producing silicon metal at the Beverly, Ohio,
8 location. At the other locations they are just idled.
9 Nothing is happening there.

10 MS. CHEN: Okay. So they're just sitting idle?

11 MR. PERKINS: Yes, ma'am.

12 MS. CHEN: Okay. What are your future projections
13 for domestic demand of silicon metal, and how do you intend
14 to respond to that?

15 MR. PERKINS: I think it's very much based on
16 market conditions, the aluminum industry, the chemical
17 industry, and obviously what the import of silicon metal is
18 going to be.

19 I think if we get relief obviously we will start
20 the plants back up, start the furnaces back up. People that
21 are on temporary furlough, we'll call them back, and we'll
22 start production. The sooner the better.

23 MS. CHEN: How much of a negative impact has your
24 lost sales and lost revenue had on your ability to raise
25 capital? You may address this in your post-conference

1 brief.

2 MR. BOARDWINE: Well, ma'am, in our case it's been
3 very significant. I mean, we've incurred lower prices,
4 lower revenue and also lower sales volume. Our normal bank
5 line has been suspended, and obviously we weren't able to
6 meet our debt. Our credit has been downgraded. Our future
7 expansion, if we're able to do it, will be extremely
8 difficult without relief.

9 MS. CHEN: You talk about planned capital
10 expenditures in your petition, which later you had to
11 cancel. How would these investments have helped your
12 companies if you were able to make them?

13 MR. BOARDWINE: Well, at SIMCALA it was
14 significant. Obviously with a three furnace plant and being
15 able to expand to a four furnace plant creates better
16 dynamics, not only more jobs but lower cost because of
17 capacity utilization of a lower plant, lower infrastructure,
18 so it would have had a dramatic impact.

19 In fact, a major part of our bond offering was
20 based on the expansion of our plant into a very healthy
21 market in 1998.

22 MR. BUTTON: This is Ken Button. If I may just
23 respond further?

24 Certainly given that domestic producers don't have
25 a capacity equal to U.S. consumption, there is room for them

1 to provide more product to you as consumers. The key
2 problem has been low prices caused by the imports, which
3 have prevented the companies from having enough of a
4 financial return to justify new money, let alone keeping the
5 current capital employed.

6 If prices are higher then it makes sense for them
7 to go ahead and the companies then are able to have a
8 positive return on their investments. Then it makes good
9 sense, for example, in SIMCALA's case to have a fourth
10 furnace in operation and similarly at Globe and elsewhere to
11 have new capacity expansion.

12 MS. CHEN: Thank you. I have no further
13 questions.

14 MR. FEATHERSTONE: Ms. DeFilippo?

15 MS. DEFILIPPO: Good morning. Catherine DeFilippo
16 from the Office of Economics.

17 Actually, most of the questions I had have been
18 asked and answered. I did have a couple quick follow ups.
19 I concur with Mr. Fischer that it would be very interesting
20 to have some of that information on the internet auctions in
21 your post-conference brief.

22 A couple of other things just to note. If you
23 could give some information on when they began and if you
24 have any idea of approximately what percent of the market
25 that purchaser is. I think you had mentioned earlier that

1 there were one or two that were large, so to give some idea
2 of how much of the market that they may account for would be
3 also helpful.

4 Dr. Button, you had mentioned in looking at
5 Exhibit 4 that there has been a shift from lower silicon
6 content to higher silicon content with the Russian imports.
7 Is that a recent occurrence, or do you have an idea of what
8 time period you might be referring to when this occurred?

9 MR. BUTTON: We actually know about that in some
10 detail, at least in terms of certain publicly available
11 information. It's been occurring for a period of time.

12 I'd have to go back. I think we could best answer
13 in the post-conference brief, but it's been going on for a
14 period of time during this period, and then there was a
15 significant increase in volume.

16 MS. DEFILIPPO: Has that allowed them to become
17 more competitive in the chemical industry?

18 MR. BUTTON: Well, they have certainly been
19 improving the quality of their product over time, and it is
20 clear that their product is acceptable to the key chemical
21 producers in the United States so that the next step was
22 price.

23 What we've seen here is that the higher purity
24 material is being sold at prices that would be more
25 appropriate for the lower purity material.

1 MS. DEFILIPPO: Okay. In regard to I think it was
2 answers to Ms. Chen's question, you mentioned that you would
3 restart some of the furnaces. In your post-conference brief
4 if you could indicate how long that would take for them to
5 come up to operating at normal levels, that would be
6 helpful.

7 With the published prices from *Metals Week*, do
8 those represent prices for just domestic product, or are
9 they a general market price that reflects both imports and
10 domestic product in the market?

11 MR. KRAMER: The *Metals Week* price is an import
12 price. It's a price to dealers for imported material.

13 MS. DEFILIPPO: The last question I had dealt with
14 the discussions we've had on long-term contracts and how
15 prices are not necessarily or how they can be renegotiated
16 or changed during the period relative to perhaps meet or
17 release clauses. I know the questionnaires tend to ask do
18 these contracts have meet or release clauses, and that's a
19 yes or no question.

20 What I'd be interested in is some additional
21 information in your post-conference brief on if your
22 companies actually have during the course of a set contract,
23 and not necessarily at the end, but during the course of a
24 contract, say a yearly contract, if you did in fact have to
25 lower prices. To the extent you can quantify that at all in

1 terms of how frequently, how many times you had to do that
2 and what volumes may have been involved in that, that would
3 be helpful.

4 I think that was all I had. I thank you for your
5 testimony this morning.

6 MR. FEATHERSTONE: Mr. Mehta?

7 MR. MEHTA: I have no questions.

8 MR. FEATHERSTONE: Mr. Greenblatt?

9 MR. GREENBLATT: Yes. I have a number of
10 questions.

11 Is there any impact from differences in production
12 process on the quality of the product? I'm talking not only
13 here, but in terms of what you know internationally and, of
14 course, in Russia.

15 MR. KRAMER: We're not aware of any significant
16 differences.

17 MR. GREENBLATT: So then any differences
18 whatsoever?

19 MR. KRAMER: Some producers are more efficient
20 than others, but they're all employing essentially the same
21 process and the same materials.

22 MR. GREENBLATT: Can you describe why one producer
23 might be more efficient than another producer in terms of
24 their production process?

25 MR. BOARDWINE: As SIMCALA stated in our

1 presentation, one of the largest areas to focus on in
2 efficiency of the set process that almost everyone uses in
3 this industry is the efficient use of electricity, which can
4 be up sometimes more than 30 percent of your actual
5 operating cost.

6 The effective smelting efficiency of converting a
7 kilowatt hour to a net ton of silicon is extremely
8 important, and the domestic producers, and particularly
9 SIMCALA, are among the best.

10 MR. GREENBLATT: Okay. Is there anything else? I
11 think electricity is a very critical issue both in terms of
12 the efficiency of using it and in terms of the ability to
13 acquire electricity at a low cost. If there's anything that
14 you would like to add at some point in the post-conference
15 brief on that topic, I would appreciate it.

16 What are the differences in the production steps
17 to make the various grades, the two metallurgical grades and
18 the chemical grade?

19 MR. PERKINS: Most of that is a post furnace
20 process, refining and that type thing. If you're making
21 extremely low iron grades, you would attempt to get some
22 lower iron feedstocks, but most of that is a post furnace
23 refining process.

24 MR. GREENBLATT: Okay. I would appreciate if you
25 could elaborate on that in the post-conference.

1 MR. PERKINS: Most of that post furnace is a very
2 minor --

3 MR. GREENBLATT: Right, but still, you know, there
4 obviously is some difference between the chemical and so on,
5 so what are the differences, and maybe if there are any cost
6 differences, even if they are fairly small, if you could
7 elaborate on that?

8 MR. PERKINS: Yes, sir.

9 MR. GREENBLATT: Approximately the range in cost
10 difference between let's say the chemical grade and the two
11 metallurgical grades.

12 MR. PERKINS: Yes, sir.

13 MR. GREENBLATT: Are there any markets in which
14 the Russian material is not suitable, any markets at all?

15 MR. PERKINS: I've seen them in all segments of
16 the market, so I would say they can sell product into any
17 segment of the market.

18 MR. GREENBLATT: And there are no exceptions?

19 MR. PERKINS: I haven't found any.

20 MR. GREENBLATT: Any import restrictions outside
21 the United States for any of the Russian material?

22 MR. KRAMER: Not that we're aware of.

23 MR. GREENBLATT: Again, if you can just check and
24 see if there might be something?

25 MR. KRAMER: Yes.

1 MR. GREENBLATT: Anything that you can add, and I
2 know this was touched on, but I would be interested a little
3 bit more on the demand trends for the three grades. You
4 know, I'd like something a little more.

5 What is the impact of transportation cost? Does
6 that have any kind of an impact in terms of, you know, the
7 markets where the Russians can or cannot and vice-versa with
8 the U.S. and various markets? Has that any kind of a market
9 impact?

10 MR. PERKINS: Yes, sir. I know we addressed that
11 in our questionnaires what that percentage is.

12 MR. GREENBLATT: Okay. Sure.

13 MR. PERKINS: I think typically in the 1997-1998
14 time frame we were able to quote a price FOB shipping point,
15 but with the increasing imports they are quoting a delivered
16 price, and we are faced with picking up that freight.

17 I know especially in the case of the Russians that
18 they now have stock points across the United States, so that
19 becomes less and less a factor in their sales.

20 MR. GREENBLATT: Can you document, again if you've
21 answered it, situations or facilities not only in the United
22 States, but internationally, where furnaces have switched
23 from ferrosilicon to silicon and vice-versa?

24 MR. KRAMER: Could you clarify that question,
25 please?

1 MR. GREENBLATT: Sure. Just document instances
2 where you are aware of where there were furnaces that
3 switched, that converted from primarily producing silicon to
4 primarily producing ferrosilicon and vice-versa, situations
5 that you're aware of.

6 MR. KRAMER: Okay.

7 MR. GREENBLATT: Can you compare, and I know this
8 was touched on. Can you compare the silicon prices in the
9 U.S. and let's say other major developed markets, and I'm
10 thinking specifically in the EU, and account for any
11 differences in prices and what are the factors?

12 Okay. My last question is this. Can you indicate
13 where the Russians made improvements in their production
14 quality specifically so that they could increase their --
15 any situation where you know specifically what kind of
16 improvements may have been made and so on?

17 Okay. I have no further questions.

18 MR. FEATHERSTONE: Ms. Noreen?

19 MS. NOREEN: I think I have just one question or
20 maybe a couple.

21 You said the Russians are stocked throughout the
22 United States, have inventories throughout the United
23 States?

24 MR. PERKINS: Yes, ma'am.

25 MS. NOREEN: Do you inventory throughout the

1 United States, too, or do you maintain inventories only at
2 your production facility?

3 MR. PERKINS: We had four production locations
4 across the United States, one on the west coast, one in
5 Niagara Falls, one in the midwest in Ohio and one in the
6 south in Selma, so, you know, just stocking at the plant was
7 enough to meet all of our customer demands on a timely
8 basis.

9 MS. NOREEN: And is that still the way you
10 operate?

11 MR. PERKINS: Yes, ma'am. Yes, ma'am.

12 MS. NOREEN: What about you, Mr. Boardwine?

13 MR. BOARDWINE: We have inventory for our
14 customers only at our production facility.

15 MS. NOREEN: The public information, *Ryan's Notes*,
16 *Metals Week*. This is I think you said the secondary
17 aluminum price. Is that correct?

18 MR. PERKINS: Typically. Yes, ma'am.

19 MS. NOREEN: And the primary aluminum and the
20 chemical grade? Would those prices be higher selling to
21 those markets, or is it really all just one price?

22 MR. BUTTON: The specific details on that, you
23 know, we would be happy to provide and give you some
24 quantitative information in the post-conference brief.

25 MS. NOREEN: Okay. There's no just general

1 information that you could give me now, I mean?

2 MR. BUTTON: Well, the generalized concept is that
3 normally the price to the chemical sector tends to be higher
4 than the price to the secondary aluminum sector. You know,
5 we spoke before about price trends, but the magnitude of
6 such differences and so forth we don't want to get into in
7 an open forum, please.

8 MS. NOREEN: Sure. Sure. See, I just thought
9 that public prices would be what you would start with, and
10 then you would try to negotiate lower. If I was a buyer and
11 I saw the public prices out there, then I would try to
12 negotiate lower than that public price.

13 What you're saying to me is that the public price
14 is really the lower price and that then you would negotiate
15 higher in certain markets? I don't mean you particularly.
16 I mean anybody. I mean the Russians. I mean anybody. Is
17 that correct?

18 MR. PERKINS: Well, typically the price that's out
19 there everybody is trying to negotiate it down obviously.
20 We haven't had very many opportunities where we could
21 negotiate the price up in the last two to three years.

22 Typically the chemical, if it's on an annual
23 contract, I mean, those prices are not as widely reported
24 obviously. There are only two of those major producers, so
25 they're not as widely reported in those magazines, the

1 publications that you see. Typically the prices that are
2 out there are secondary aluminum.

3 MS. NOREEN: Okay. Thank you, gentlemen.

4 MR. FISCHER: Fred Fischer, Office of
5 Investigations. I just have two very brief questions.

6 Are you aware of any low silicon imports from
7 Russia, meaning I guess silicon less than 96 percent?

8 MR. KRAMER: We're not aware of any such material.
9 The only below 96 percent material we've ever encountered is
10 circumvention material manufactured intentionally for that
11 purpose by adding aluminum, which is not an impurity.

12 We've encountered that in the Chinese material in
13 particular, but not to date in the Russian material.

14 MR. FISCHER: I just happened to notice it's in
15 the scope, and I think I understand why it is. I just had
16 to ask the question.

17 Finally, are you aware of any Chinese or Brazilian
18 silicon metal imports that have been classified as Russian
19 material, Russian imports?

20 MR. KRAMER: We read the press report suggesting
21 some such flow of material exists. We have no evidence that
22 it exists, and we haven't -- you know, we do track those
23 things. If there is any such flow, we don't think it's
24 significant.

25 MR. FISCHER: Okay. Thank you very much.

1 MR. FEATHERSTONE: Thank you all again for your
2 testimony. Sorry about the microphone problem.

3 We'll take a ten minute break, at which point if
4 Respondents could come forward, please?

5 (Whereupon, a short recess was taken.)

6 MR. FEATHERSTONE: Can we resume the conference,
7 please?

8 Welcome, Mr. Waite. Please proceed at your
9 convenience.

10 MR. WAITE: Thank you, Mr. Featherstone, and
11 thanks to the members of the staff. My name is Fred Waite
12 of the firm of Holland & Knight. With me is Kimberly Young.
13 We represent SUAL Holding and its affiliated producers of
14 silicon metal in Russia, ZAO Kremny and SUAL Kremny Euro,
15 Ltd.

16 We are joined today by Dr. Patrick Magrath and
17 Brad Hudgens of Georgetown Economic Services and Mr. Peter
18 Appleby, who is president of Greenwich Metals, Inc., an
19 importer of silicon metal from Russia.

20 Our panel also includes Michael Stein and Brent
21 Bartlett of Dewey Ballantine and Ms. Marcia Haynes of GE
22 Silicones. Finally, we have Thomas Wilner and Quentin Baird
23 of Shearman & Sterling who represent the other Russian
24 producer of silicon metal, Bratsk Aluminum Smelter.

25 Dr. Magrath will begin our testimony this morning.

1 MR. MAGRATH: Good morning, Mr. Featherstone,
2 members of the Commission staff. Ladies and gentlemen, my
3 name is Pat Magrath. I am managing director of Georgetown
4 Economic Services. With me today is Brad Hudgens of GES, as
5 Mr. Waite has said.

6 As is typical in a preliminary investigation, we
7 Respondents are made to play catch up. In our case, we were
8 granted APO to the petition only yesterday. Therefore, we
9 are going to use our time today to talk about some points we
10 have gathered from public sources that we would like the
11 Commission to consider. We would hope to expand our
12 arguments once APO material is available in the post-
13 conference brief.

14 Let's start with the bottom line first. Silicon
15 metal is a world commodity, a basic mineral that is easily
16 mined and derived from an abundant raw material, silicate,
17 around the world. As the U.S. Geological Survey has put it,
18 "World and domestic resources for making silicon metal and
19 alloys are abundant and in most producing countries adequate
20 to supply world requirements for many decades."

21 It is a basic mineral building block for many
22 major industrial products from aluminum to chemicals to
23 silicon electrical steel. Many countries produce it. Many
24 export it, and many export it to the United States and will
25 continue to do so irrespective of this present action.

1 It is a commodity, as Petitioners have emphasized,
2 and the fact is that silicon metal from one source can
3 readily substitute for silicon metal from another source.
4 Its abundance and commodity nature makes it an endearing, or
5 I should say an enduring trade problem to the higher cost
6 U.S. producers. I don't think that was the correct word.

7 We would like to emphasize to the staff and the
8 Commission from the outset the very real and substantial
9 presence of non-subject imports in this investigation. As
10 the staff and Commission know, the U.S. silicon metal
11 industry is no stranger to the ITC. The most recent
12 proceeding involving this product and industry was just a
13 little over a year ago in a sunset review against Argentina,
14 Brazil and China.

15 Although the trade press articles provided in the
16 petition gave testimony to the beneficial impact of these
17 orders, these effects were before the POI or very early in
18 it. Currently, the major Brazilian producers are carrying
19 zero percent cash deposit rates and appear headed for
20 revocation of their orders.

21 Argentina's order, as you know, was terminated in
22 sunset review. Guess what? Imports from Argentina, zero in
23 1999 and 2000, reappeared in 2001 in significant quantities
24 at very low prices; in fact, lower prices than Russia's.

25 The Chinese, despite higher duties, continue to

1 ship at very low prices, again lower than Russia's. In
2 fact, the Chinese are currently making offers to large end
3 use customers of significant quantities available for export
4 to the U.S. market. Later witnesses, Ms. Haynes, will
5 provide details.

6 These three subject countries should be added to
7 the long list of other foreign suppliers of silicon metal to
8 the United States, most notably in terms of volume South
9 Africa and Canada, and new entrants on the rise and again
10 with very low prices, Spain, Saudi Arabia and Argentina.

11 In fact, Petitioners' Exhibit 37 in their
12 petition, an import table, shows seven major supplying
13 countries, including South Africa, the largest import source
14 over the POI, with average unit values lower than Russia on
15 a contained metal basis. These countries lower than Russia,
16 I should add, increased from three lower than Russia in 1999
17 to six lower than Russia in 2000, to seven lower than Russia
18 in 2001.

19 A review of the import trends of silicon metal
20 shows that imports from Russia were at ten year lows in 1999
21 and 2000, and the increase to 2001 levels was still below
22 the average of the prior seven years. Furthermore, overall
23 imports declined between 2000 and 2001. To the degree that
24 imports from Russia increased during this period shows that
25 these imports resumed their normal trading levels, and if

1 they displaced any source of silicon metal it was other
2 imports rather than domestic production.

3 Nevertheless, given the information provided in
4 the petition and the trade press articles we have hurriedly
5 collected in the past few days, we are not going to deny
6 that the current silicon metal producers in the United
7 States have been through a difficult period recently, but so
8 have many industries in the United States.

9 Thus, we respectfully urge the Commission and the
10 Commission staff to put these alleged declines in the
11 industry within the context of the recession that hit this
12 country's manufacturing sector in 2000, continued through
13 calendar year 2001 and is estimated to be abating only very
14 recently.

15 Using public data, we can see that, and this is
16 unfortunate for all of us here in this country, the
17 deterioration of certain indices of the U.S. silicon metal
18 industry were no worse than that of many other U.S.
19 industries producing basic industrial commodities.
20 According again to the U.S. Geological Survey statistics,
21 production of silicon metal in the United States declined by
22 seven percent between 1998 and 2000, the most recent data
23 available.

24 However, under the weight of the decline in the
25 general economy which hit disproportionately the nation's

1 manufacturing sector, production of ferrosilicon, a closely
2 related product, fell by 25 percent. Ferro alloys as a
3 whole, their production fell 20 percent, and copper, another
4 basic industrial mineral dropped by 16 percent. Placed in
5 this context, declines in silicon metal production of the
6 magnitude reported were predictable, not unusual.

7 Importantly, it was acknowledged in the sunset
8 review of this same product that the demand for silicon
9 metal is derived from the demand for the two end products
10 that absorb the great bulk of shipments, the chemical and
11 aluminum industries. These two industries both suffered
12 steep production declines from 1999 to 2001.

13 According to USGS again, production of aluminum
14 fell by 30 percent, and chemical products dropped by ten
15 percent. As these large consuming industries felt the
16 squeeze of declining demand, they came under pressure to
17 reduce their prices to move their products in this
18 contracting market. In turn, they turned to their upstream
19 supplier of input products not only, but including, the
20 silicon metal producers, to lower their prices as well.

21 An obvious structural problem here is that the big
22 consumers of silicon metal in the United States, which you
23 have heard earlier this morning, the Dow Chemicals and the
24 Alcoas of the world, have the benefit of being able to
25 request bids from some 20 odd foreign suppliers, as well as

1 U.S. producers, for purchases of this basic abundant
2 commodity. This natural buyers' advantage is magnified in
3 periods of slack demand and recession. That's no surprise.
4 Such is the current period.

5 It is also exacerbated by this world commodity the
6 way it is sold via an auction type process and even by the
7 new communications technology of which you have heard
8 earlier. Ms. Haynes from GE will describe how GE buys
9 silicon worldwide by internet auction. Mr. Appleby will
10 also provide details of this auction process.

11 Our conclusion is one we hope the Commission will
12 also reach. If Russian imports disappeared tomorrow,
13 neither the overall volume or price of this world commodity
14 would be affected in the U.S. market.

15 Corroborative evidence of this downward pressure
16 on prices from once again these large consuming industries
17 in particular and the slowing economy in general is
18 plentiful in the trade press. As early as November, 1998,
19 the *American Metal Market* quoted a spokesman from Dow
20 Corning as stating publicly that the "Asian economic crisis,
21 currency fluctuations and inflationary cycle," has caused
22 Dow customers to demand price concessions from it on
23 chemical products and that, "It is a more demanding world
24 for silicon. There have been price concessions, severe
25 stress on sales contribution margins and operating

1 profitability. Silicon suppliers are fighting it out."

2 A year later, in September, 1999, silicon metal
3 prices were reported to be "riding a price slide" due to
4 expanded operations by domestic producers. These quotes are
5 from the 1998-1999 period when imports from Russia were
6 declining severely from historic levels. This pressure from
7 large buyers back to vendors is unfortunately again not
8 unusual and not related to imports from the Russian
9 Federation. It is how a recession spreads through an
10 economy.

11 With these factors in mind, we are skeptical of a
12 petition stating that, "The most obvious indicator of the
13 industry's injured condition is the fact that two domestic
14 producers have been forced to cease silicon metal production
15 operations."

16 These closures were clearly not a result of
17 competition with imports from Russia. One of these
18 producers, American Alloys, stopped producing silicon metal
19 in April, 1998, which is outside the Commission's period of
20 investigation. Second, the other producer that ceased
21 silicon metal production, American Silicon Technologies,
22 began having financial difficulties well before the period
23 of investigation, according to the petition.

24 When the company closed its silicon metal
25 operations in September, 1999, imports from Russia were

1 declining significantly by 36 percent, while imports from
2 South Africa, Brazil and Canada were increasingly displacing
3 the Russian product. Russia was not even the primary source
4 of imports during 1999, as imports from Canada and South
5 Africa were higher during that period.

6 Consequently, to blame the closure of these two
7 producers on imports from Russia is not credible. Imports
8 from Russia steadily declined between 1998 and 2000 as
9 buyers reacted to better prices from other imports and they
10 displaced Russian volumes.

11 SIMCALA, which is one of the Petitioners here
12 today, clearly indicated the reason why these producers went
13 out of business. In the company's 10-Q financial
14 statements, SIMCALA indicated that poor demand conditions
15 and excess domestic supply, not imports, not even imports
16 from Russia or imports in general, were the reason that U.S.
17 prices remained depressed during that period. I will quote
18 directly from its 10-Q statement.

19 "Historically, the company's silicon metal
20 business has experienced price fluctuations principally due
21 to the competitive nature of two of its markets, the primary
22 and secondary aluminum markets. In addition, additional
23 domestic production capacity (emphasis added) was added by
24 two competitors at a time when demand was not growing at
25 historical rates. This additional capacity created an

1 oversupply of silicon metal in the domestic markets. This
2 excess supply continues to depress prices in all aluminum
3 markets in which the company competes."

4 Consequently, imports from Russia were not the
5 cause of these two producers' financial woes, but rather an
6 oversupply of silicon metal from domestic sources causing
7 poor market conditions. That's again not our opinion. We
8 are quoting. That was one of the Petitioners. We urge the
9 staff to investigate these facts and put them before the
10 Commission in this preliminary investigation.

11 Finally, I would like to make an important point
12 concerning the conditions of competition, and this is in
13 contradiction to some of the testimony this morning. Russia
14 is precluded from an important segment of the silicon market
15 because no Russian producer is qualified to manufacture low
16 iron silicon metal, that which contains less than 0.35
17 percent iron. Mr. Appleby will speak to this issue.

18 This low iron product is used in the automotive
19 industry to produce alloy wheel rims and other products and
20 accounts for a significant portion of the primary aluminum
21 market. With imports from Russia not able to even compete
22 in this significant share of the U.S. market, Petitioners'
23 claims of material injury as a result of imports from Russia
24 and Russia alone, since all of their imports are fairly
25 traded, are further weakened.

1 In conclusion, we are aware of the relatively low
2 threshold for an affirmative preliminary determination and
3 that imports from Russia were the single largest foreign
4 supplier to the United States market in 2001, but that's
5 our point. Russia was the "single" largest import source, a
6 single source among the following problems dragging down the
7 domestic industry.

8 First and foremost, Russia was a single source of
9 imports, one of numerous and very competitive import sources
10 for this commodity type, globally plentiful, basic mineral.
11 Imports in the POI from Russia are well off their historical
12 levels, and over the POI period they averaged a little over
13 20 percent of import supply. That means that fairly traded
14 imports were four times Russian volumes, and those imports
15 are beyond this case's reach.

16 Imports in general, if a problem, were only one of
17 a host of other problems plaguing the U.S. over and well
18 before the current 1999 to 2001 period. These include ill-
19 timed domestic capacity expansions just as the sector and
20 general economy were turning down, high domestic energy
21 costs, energy cost spikes and the collapse in mid 2000 and
22 2001 of the manufacturing sector in this country and as part
23 of that collapse the decline in demand, the downward price
24 pressure and the major consuming industries silicon metal
25 and other basic minerals sell to.

1 If the Commission looks at these myriad of
2 problems against a Russian industry that has gravitated
3 towards long-term contracts and stable pricing here in the
4 U.S. market, it hopefully will determine that the causation
5 link here is too weak and is too overwhelmed by other causes
6 to continue this case past this preliminary phase.

7 Thank you very much for your attention.

8 MR. WAITE: Thank you, Pat.

9 I will now turn our presentation over to Mr. Stein
10 and Ms. Haynes.

11 MS. HAYNES: Mr. Featherstone and members of the
12 Commission staff, good morning. I'm Marcia Haynes. I'm the
13 general manager of Global Sourcing for GE Silicones. It's a
14 business unit of the General Electric Company.

15 I am responsible for purchasing the silicon metal
16 that is the principal input of the silicon products my
17 company produces. My job is to purchase materials from
18 qualified suppliers at the lowest possible price.

19 The chemical grade silicon metal we purchase is a
20 commodity product. Once a company is qualified to supply
21 us, price is the principal determinant, although we attempt
22 to purchase from a variety of sources. Company policy
23 prevents us from obtaining our supplies from a single
24 source.

25 If we have to pay more for silicon metal than our

1 competitors do, we will lose business, particularly in the
2 United States. As it is, our Asian and European affiliates
3 and competitors who are able to purchase silicon metal for
4 less than we can are putting tremendous pressure on me to
5 purchase this material at the lowest possible price. In
6 short, we are not in a position to pay more for silicon
7 metal. We either purchase at a competitive price or
8 decrease production at our U.S. facilities in favor of
9 facilities abroad.

10 There are many suppliers both in the United States
11 and abroad that are qualified to sell silicon metal to us.
12 Should the Commission and the Department of Commerce make
13 affirmative determinations and impose an antidumping duty
14 order on Russia, we would not purchase from American
15 companies at a higher price.

16 Rather, we would redirect our purchases to our
17 other qualified suppliers from Canada, Brazil, South Africa
18 and China, all of whom trade fairly in our market, or to any
19 suppliers from the United States willing to meet or beat the
20 prices charged by these fair value suppliers. I can assure
21 the Commission that GE Silicones has its pick of eager
22 suppliers, as the worldwide demand for silicon metal is
23 unusually low and supplies are plentiful.

24 Given current market conditions, an antidumping
25 duty order would have the following effects. It would

1 deprive GE Silicones of a valued supplier and push its
2 business to other foreign suppliers. It would not help the
3 U.S. industry at all.

4 GE Silicones has established an auction procedure
5 -- you heard mention of it earlier this morning -- on the
6 internet for the purchase of the bulk of our silicon metal
7 needs. GE Silicones sets a maximum price and a reserve
8 price, and once the auction opens qualified bidders may
9 continue to put in new bids so long as they're lower than
10 the last. We call this process, by the way, a reverse
11 auction. After no new bids have been received for two
12 minutes, the auction closes.

13 GE Silicones held three separate auctions in the
14 fall of 2001 for our 2002 requirements. We hold separate
15 auctions because we do not wish to be too dependent on one
16 or two suppliers. We have provided you a bid-by-bid account
17 of these auctions as an addendum to our questionnaire
18 response.

19 The auction histories demonstrate the lack of
20 causal connection between Russian imports and injury to the
21 U.S. industry. The petitioning U.S. companies did not
22 participate because they refused to meet even the beginning
23 price. It can hardly be said that unfair imports from
24 Russia injured them when fairly traded products were
25 available at much lower prices and the fairly traded and

1 Russian imports ultimately were available to us at virtually
2 the same price.

3 In fact, in one auction a non-petitioning American
4 company won one lot, and a Russia company won another. They
5 beat out a Canadian company by \$1 per ton. In another
6 auction, neither American nor Russian companies competed.
7 Suppliers from Brazil, Canada and China competed. The
8 resultant price was virtually identical to the final prices
9 where Russian and American companies did compete. Plainly,
10 Russian imports have no impact on the overall price levels
11 of silicon metal in the American market because of the
12 prevalence of fairly traded imports.

13 My lawyers tell me, Mr. Stein on my left, that the
14 law is clear. A number of Court decisions stand for the
15 proposition that if we can buy our requirements from Canada
16 or Brazil, South Africa or China, at virtually the same
17 price as from Russia, there is no causal link between
18 Russian imports and the injury to the U.S. industry. We
19 can, and, if necessary, we will. There is no sense in which
20 our position is unique. This is a global business with
21 suppliers and competitors around the world.

22 With regard to the purchases of silicon metal,
23 there is nothing special about GE Silicones. Our
24 competitors can purchase the same materials at comparable
25 prices, and global competitiveness is a must for survival.

1 These are not good times for any of us. The
2 dollar is unusually strong, hurting both potential domestic
3 suppliers and us. Demand for product is down. One of our
4 major competitors recently expanded offshore, further
5 reducing demand for U.S. produced silicon metal. The
6 California energy crisis reduced aluminum production and,
7 therefore, demand for metallurgical silicon metal.

8 While my lawyers also tell me that the Commission
9 is not supposed to weigh causes of injury, it also may not
10 attribute injury caused by other factors to dumped imports.
11 Russian imports take sales that otherwise have been made by
12 fair value imports. They simply do not contribute to any
13 harm being suffered by the domestic producer.

14 In summary, the record of this preliminary
15 investigation contains irrefutable evidence that Russian
16 imports are not injuring the domestic industry producing
17 silicon metal because fair value imports stand in the way of
18 increased sales and prices for domestic material.

19 There is no possibility that contrary information
20 will be obtained in any final investigation. Therefore, the
21 only correct result is a determination that there is no
22 reasonable indication of material injury or threat of
23 material injury.

24 MR. WINTON: Thank you, Marcia.

25 MR. WAITE: Our panel's next witness is Peter

1 Appleby, President of Greenwich Metals, Inc.

2 MR. APPLEBY: Good morning. My name is Peter
3 Appleby and I'm President of Greenwich Metals, Inc., in
4 Greenwich, Connecticut. That's what it says.

5 Greenwich Metals is an international trading
6 company, established in 1992, specializing in non-ferrous
7 metals, including silicon metals. We source all grades and
8 sizes of silicon metal, to ensure that we provide material
9 conforming to our customer's specific requirements. I,
10 personally, have been involved in the marketing and sale of
11 silicon metal in North America for more than 25 years.

12 Last year, Greenwich Metals negotiated an
13 exclusive arrangement with SUAL, concerning their two
14 related Russian silicon plants, ZAO Kremny in Siberia and
15 SKU in the Urals. Since that time, Greenwich Metals has
16 been acting as the exclusive North American agent for these
17 plants, with respect to sales of their metallurgical grade
18 silicon.

19 We market this metals to customers in both the
20 primary and secondary aluminum markets in the United States
21 and in Canada, and these companies then use the silicon as
22 an input in their production. Our customers include large
23 aluminum producers, such as Alcoa and Alcan, and also
24 secondary aluminum producers, as well as smaller consumers
25 that use silicon for their dye casting and extruding

1 operations. Greenwich Metals is not the marketing agent for
2 the chemical grades, which the SUAL plants produce for the
3 large U.S. chemical customers, like Dow and GE.

4 As a result of our long-term presence in the
5 aluminum and aluminum alloys market, Greenwich Metals has
6 been able to increase the number of customers committed to
7 long-term contracts for Russian silicon. This benefits not
8 only the Russian producers, who are assured an experience
9 team of dedicated professionals with knowledge of the North
10 American market; but, it also ensures that the supply from
11 these producers is based on a long-term view of the market,
12 rather than on potential short-term gains.

13 Silicon metals is a commodity product and the
14 metallurgical grades from Russia are generally
15 interchangeable with those from domestic producers, as well
16 as from other sources, such as South Africa, Canada, China,
17 and Brazil. However, as the petitioners noted, there is a
18 segment of the U.S. market that requires a lower iron
19 content in its metallurgical grades of silicon. This
20 segment of the market is primarily occupied by primary
21 aluminum producers that produce low iron foundry alloys for
22 products such as alloy wheel rims for automobiles. Because
23 the composition of the quartz site deposits in Russia,
24 metallurgical grade silicon from Russia does not meet the
25 iron content standards for this application. Therefore, the

1 low iron product that is available from the U.S. producers
2 and other import sources is a product that the Russians --
3 that the Russian plants cannot supply.

4 This iron content requirement is a limitation for
5 us in many sales. For example, last year, a large primary
6 aluminum producer issued a tender offer for its silicon
7 needs for the calendar year 2002. The total quantity of
8 silicon metal available to be supplied under that tender was
9 14 million pounds. Approximately 75 percent of that
10 quantity was for material with an iron content of 0.20
11 percent or less. As a result, we were unable to bid on a
12 substantial portion of this business.

13 I'd also like to note, like the chemical silicon
14 market, there are instances of Internet auctions for
15 metallurgical grade silicon. For example, last year, we bid
16 and won the contract with one of the automobile companies
17 for its 2002 silicon requirements. Our experience in that
18 auction was similar to the GE auction that Ms. Haynes
19 described earlier. These auctions are a new feature in the
20 silicon market; but, in my opinion, they have not changed
21 the buying process, which still includes fax bids, telephone
22 offers, and face-to-face negotiations.

23 Finally, there was one point that I wanted to
24 make. There was a recent article in the trade press
25 purportedly quoting someone representing the Russian plants,

1 suggesting that they are accelerating their shipments to the
2 United States, as a result of this case. It was mentioned
3 earlier and given credit to Metals Week. The editor of
4 Metals Week is here today and she pointed out to me, it was
5 not Metals Week, it was the American Metal Market.

6 As their -- as SUAL's North American
7 representative, I just want to set the record straight, we
8 have not, nor are we planning to increase our imports of
9 silicon metal from Russia, in an attempt to flood the
10 market. The plants are continuing to ship silicon metal
11 according to an established schedule, in order to satisfy
12 existing customer requirements. I don't know who the source
13 was of that article; but whoever it was, they were not
14 authorized to speak for the Russian plants and they
15 certainly weren't speaking for Greenwich Metals. And we are
16 SUAL's exclusive North American representative.

17 Thank you for the opportunity to allow me to
18 appear here today. I'd be happy to answer any questions.

19 MR. WAITE: Thank you, Peter. Dr. Magrath has one
20 comment and then Mr. Stein will make a concluding statement
21 on behalf of our panel.

22 DR. MAGRATH: Yes. Thank you, again. Pat
23 Magrath, Georgetown Economic Services. I just had a couple
24 of quick comments on the exhibits that were -- that were put
25 up by petitioners.

1 First of all, on their Exhibit 4, which is U.S.
2 imports of silicon metal from Russia, volume and AUV, Dr.
3 Button made much of the -- of the lack of correlation or the
4 negative correlation in the last couple of quarters of 2001.
5 But, if you take all of these quarters and draw the -- draw
6 the vertical lines, actually, seven of 11 quarters, there is
7 a positive -- there appears to be a positive correlation
8 between the volume and the AUV. And I'm indebted to Mr.
9 Wilner for that remark, which means if this turns out wrong,
10 blame Wilner, don't blame me.

11 Exhibit 5 is -- appears to be even more
12 misleading. These two things that are charted here are --
13 one is a Metals Week published price; the other is Russian
14 AUV. It's not an index graph, so it's real prices and cents
15 per pound. These are different levels of trade. This is a
16 Metals Week price, which one of the witnesses of petitioners
17 explained was an importers price to dealers. The other is
18 the Russian AUV. I don't know whether it's FOB or CIF. But
19 if it's FOB, of course, you've got ocean transportation.
20 Even if it's -- and you've got inland transportation in the
21 United States and you, of course, have the 5.5 percent
22 tariff.

23 Added to that is the testimony that Ms. Noreen
24 solicited, that really this published price in this very
25 weak economic climate, the published price is being pushed

1 down. So, it's being pushed down towards the AUV. I
2 wouldn't be surprised if this were brought to the same level
3 of trade and we had an apples to apples comparison, if the
4 Metals Week price actually -- or the Russian AUV price built
5 up appropriately would even be higher than Metals Week
6 price. It's very close here most of the period.

7 Thank you, very much.

8 MR. STEIN: Good morning. I'm Michael -- for the
9 record, I'm Michael Stein, of counsel to Dewey Ballantine
10 and counsel for General Electric Silicones in this
11 proceeding.

12 I'm not usually on this side of the table. I've
13 devoted my career, in fact, to defending and trying to
14 preserve trade remedies, because I truly believe that they
15 are the only way that an open market can protect itself from
16 unfair practices from protectionist countries or countries
17 that subsidize or engage in industrial targeting.

18 The job of those of us, who defend the trade laws,
19 is made infinitely more difficult, if the laws are misused
20 and if remedies are imposed in cases where there isn't
21 unfair trade or where the remedy will harm some and not help
22 others. That is exactly this case.

23 Fair value imports are an intervening cause of
24 injury. I agreed with almost everything that the petitioner
25 said this morning about the state of their industry, about

1 it being commodity product. The only source of disagreement
2 is what's causing their current distress.

3 Fair value imports simply dwarf Russian imports,
4 as you can see from the handout that we asked to be put in
5 the record. To the extent that Russian imports increased
6 from 2000 to 2001, that increase is dwarfed by the decrease
7 in fair value imports from numerous sources. There is not a
8 scintilla of evidence that Russian imports are in anyway
9 displacing domestic production and we have a laboratory
10 experiment to prove it.

11 As you've heard from Marcia Haynes and as you have
12 as an addendum to General Electric's questionnaire response,
13 there were three separate auctions that General Electric
14 Silicones conducted a few months ago. In one of those
15 auctions, neither Russia -- Russian producers, nor Americans
16 participated. Yet, the price in that auction was almost
17 identical to the price where Russians and Americans did
18 compete. In a second auction, Americans did not compete;
19 the Russians did. They shared the award with the Canadians.
20 In the third auction, again, both -- neither petitioner was
21 even willing to compete.

22 In those circumstances, it is absurd to say where
23 fair value imports are available at prices substantially
24 below where the domestic industry is even willing to quote,
25 that imports from a different source are causing injury, and

1 as Ms. Haynes observed. I did advise her that the law is
2 clear and I would like to refer to the Jerald Metals case
3 from the Federal Circuit. "While the" -- and I'm quoting,
4 "while the statute protects domestic magnesium producers
5 from injury caused by LTFV imports, its scope of protection
6 does not reach so far as to support artificially inflated
7 prices, where fairly traded imports are underselling the
8 domestic product and LTFV imports are readily convertible to
9 fairly traded products by merely changing importers."

10 What we have here is a situation where domestic
11 consumers of silicon metal are able to fulfill their needs
12 from numerous sources, only one of which is alleged to be
13 unfairly traded. And it is true, one thing I do have to
14 mention is we're talking here, GE's experience is in the
15 chemical area. But, I think we can take petitioners at
16 their word, that there really isn't any difference between
17 the availability of silicon in the -- silicon metal in the
18 chemical and metallurgical areas. That is the -- to the
19 extent that there is any differentiation in these markets,
20 and we don't really think there is, the chemical grades are
21 the higher grades.

22 So, the countries that make fair value chemical
23 silicon metal available also are making metallurgical
24 silicon metal available, again at prices so far below where
25 the domestic industry is prepared to compete, that they

1 break any conceivable chain of causation from Russian
2 silicon metal in these circumstances. And, in fact, if the
3 Russian companies disappeared tomorrow, there would be no
4 difference. There is -- the world is a wash in silicon
5 metal.

6 It's not always this way; it's a cyclical
7 industry. When I first started -- when these folks first
8 called me up, it was because they couldn't get silicon
9 metal. There was a shortage -- I mean, 1955, you know, in
10 the -- and they were -- they were so desperate that they
11 became importer of record from silicon metal from Brazil,
12 while it was under order. So, conditions do change. But,
13 at this time, this record is more than clear that imports
14 from Russia are not causing injury.

15 Usually, you don't have this level of
16 transparency. Imports from various sources are all
17 competing and petitioners can sometimes make a plausible
18 claim that the -- that one particular country is a price
19 leader and they're dragging everybody down. Two problems
20 with that: first is there is no plausible -- really
21 plausible information on the record that Russia is a price
22 leader; and the second problem is even if Russia were a
23 price leader, the fact that there are all these -- even if
24 Russia is down here, because there are all these intervening
25 fair value imports between the Russians and the domestic

1 industry, those fair value imports just simply break the
2 chain of causation.

3 This is not a case that deserves to go forward.
4 Silicon metal is sold all over the world. There are
5 numerous suppliers. They have to -- this is an industry.
6 It's not subsidized. There are no sanctuary markets. There
7 is no -- there is -- it's basically lowest cost producer
8 wins. At the moment, for a number of reasons, electricity
9 costs, the strength of the dollar, there are lower cost
10 producers out there and they are not dumping. And in these
11 circumstances, if the Commission fails to recognize these
12 particular conditions of competition, it just simply brings
13 these laws into disrepute. And I urge you to advise the
14 Commission of the facts that are so evident on this record.

15 Thank you.

16 MR. WAITE: Thank you, Mike. Mr. Featherstone,
17 that complete our panel's testimony. We're available for
18 any questions from you and the staff.

19 MR. FEATHERSTONE: Thank you, Mr. Waite, all the
20 witnesses for your testimony. We'll accept the chart, Mr.
21 Stein, that you referenced, as Conference Exhibit 2.

22 Mr. Fischer?

23 MR. FISCHER: Thank you all for your testimony. I
24 just have a few brief questions. Are you aware of any low
25 silicon imports from Russia -- low silicon imports from

1 Russia within the scope, but less than 96 percent silicon
2 content?

3 MR. WAITE: Below --

4 MR. FISCHER: I'm sorry, the circumvent -- in
5 other words, any Russian imports entering the United States
6 with less than 96 percent silicon content that would still
7 be within the scope.

8 MR. APPLEBY: Let me answer that -- Peter Appleby.
9 No. As far as we know, there are no imports of low content
10 silicon metal.

11 MR. WILNER: Wait a second. I need to answer
12 that. I thought this would be the first ITC hearing I ever
13 got through without talking, but I think our -- yes, we are
14 aware of some. Our company does have some. We'd like to do
15 this -- this is not a circumvention issue. We do have some.

16 MR. FISCHER: If possible -- I don't believe the
17 questionnaire response asked for a breakout, but if you
18 could provide us, in your confidential response, a breakout
19 of those imports over the time period we're asking for, that
20 would be helpful. Thank you.

21 I have some questions regarding the Internet
22 auctions for Ms. Haynes, but I think I'll defer to Ms.
23 DeFilippo. Let me ask them now. Basically, if you could
24 elaborate a little bit more on, I guess, the specifics of
25 how the auction works and -- well, I guess the question to

1 you: are all of your purchasing requirements now done by
2 your Internet auction?

3 MS. HAYNES: Not 100 percent. About -- this year,
4 our target is 75 percent for our total buy on auctions.
5 Obviously, auctions work where there's competition and you
6 have multiple sources. So, in those instances where we
7 don't, then we just go traditional negotiation.

8 MR. FISCHER: And typically, that is a one time a
9 year event?

10 MS. HAYNES: It depends on the market. You know,
11 when you do chemical commodities, there may be a reason to
12 do quarterly auctions or auctions every six months. But
13 silicon matter, we try to keep it as stable as possible, at
14 least around a year.

15 MR. FISCHER: I'd have to review your
16 questionnaire response, but if you could provide -- if it
17 isn't provided already in your questionnaire, if you could
18 provide a history of your auctions throughout this period.

19 MS. HAYNES: Okay.

20 MR. FISCHER: Timing, total quantities, that sort
21 of information. That's all the questions I have for now.
22 Thank you.

23 MR. FEATHERSTONE: Ms. Chen?

24 MS. CHEN: Good morning. Irene Chen from the
25 Office of General Counsel. Do you agree with petitioners'

1 characterization or definition of the domestic like product?

2 And, if not, why not?

3 MR. STEIN: For purposes of this preliminary
4 investigation, we do not dispute it.

5 MS. CHEN: And a follow-up question regarding
6 domestic industry, do you agree with petitioners'
7 characterization of the domestic industry?

8 MR. WAITE: In what respect, Ms. Chen?

9 MS. CHEN: Basically, they characterized domestic
10 industry as consisting of the domestic producers of silicon
11 metal. Do you agree with that?

12 MR. WAITE: Yes. For purposes of the preliminary
13 investigation, we do agree with that; yes.

14 MS. CHEN: Turning to the issue of related
15 parties, if you could please discuss, in your post-
16 conference briefs, whether you believe any of the domestic
17 producers are related. This, I guess, relates to that
18 question, as well. If so, whether appropriate circumstances
19 exist to exclude any of those firms from the domestic
20 industry.

21 MR. WAITE: We will address those questions in our
22 post-conference brief.

23 MS. CHEN: I know it was discussed earlier today,
24 some of the factors -- some of the conditions of
25 competition. If you could please elaborate on that, what

1 conditions of competition you believe the Commission should
2 consider in your post-conference briefs.

3 Can you please discuss the quality of Russian
4 silicon metal and how it compares to U.S. silicon and
5 whether or not quality becomes an issue in purchasing?

6 MR. WAITE: I think that Ms. Haynes and Mr.
7 Appleby are probably the best situated to respond to that
8 question.

9 MS. HAYNES: I mean, all of our -- all of our
10 suppliers expected to meet the GE silicon specification and
11 Russia does that today. So, there's no significant
12 difference between, you know, the material that they sell
13 us. I don't know if that --

14 MR. APPLEBY: There's three producers in Russia of
15 silicon metal. Bratsk, as we understand, only produces a
16 certain quality that can go into the secondary aluminum
17 industry. The other two SUAL plants, ZAO Kremny produces
18 the refined grade that can be used by the chemical industry,
19 and, to a certain extent, by the primary aluminum industry.
20 The third plant, SKU, does not have refining capability and,
21 therefore, their product is not qualified by the chemical
22 users and is principally used by the secondary aluminum
23 industry and, to a certain extent, by the primary aluminum
24 industry.

25 MR. WILNER: Let me also add, as Peter did in his

1 testimony, it's my understanding, I believe that's
2 absolutely correct, but it's my understanding that none of
3 those plants can produce the low iron content product
4 required for a large portion of the U.S. primary aluminum
5 market.

6 MR. APPLEBY: Correct.

7 MS. CHEN: How would you address the petitioners'
8 claims that Russian silicon metal has increased in quality
9 over the last year or so, causing this surge in Russian
10 imports? Do you agree with that?

11 MS. HAYNES: I think it is not -- it's not only
12 Russian silicon. Almost all of the producers from the
13 emerging markets, the quality has improved. And so what
14 tends to happen in this industry, is you identify a source
15 and you work with that source to get it up to the level of
16 quality that you want them to perform at. And that's where
17 the Russian silicon -- certainly, chemical producer that we
18 work with is performing today.

19 MS. CHEN: And when you say that you work with the
20 suppliers, you mean that you identify these sources by price
21 first and then work with them --

22 MS. HAYNES: No. Typically, you identify the
23 source first. You know that they can produce silicon metal,
24 chemical grade silicon metal. You test it. You give them
25 input. You look at it more -- you know, we talk a lot about

1 prices. There's a lot that goes into looking at the
2 environmental standards and all that before we even decide
3 to work with them. So, we test. We give them input. They
4 change and gradually the standard goes up.

5 MR. WILNER: Ms. Chen, can I respond to your
6 question just a bit, too --

7 MS. CHEN: Yes, certainly.

8 MR. WILNER: -- because I think it puts it in some
9 perspective. From a technical standpoint, it seems to me
10 that some of the Russian -- one of the Russian plants can
11 now meet this qualification, so it's in that market for the
12 chemical grade. And in doing so, it's not that that's
13 allowed it to surge. In doing so, it is competing with
14 other imports doing that and has replaced other imports, as
15 Mr. Stein has pointed out. Let me draw it down again. So,
16 that's what happened. I mean, if it's in a surge, it's been
17 a surge at the expense of other imports without the U.S.
18 producers really competing in there. As Mike said, it's an
19 intervening cause.

20 But let me make another point, which I think is
21 important. My client, Bratsk, as Peter said, cannot make
22 the high quality product. It cannot make it. It is in a
23 market where everyone and anyone in the world, who produces
24 silicon metal, can produce that product. So, it is in
25 competition with the whole world of fairly traded imports.

1 And to the extent it's made sales, it's been at the expense
2 of other fairly traded imports and not at the domestics, as
3 well.

4 MR. STEIN: Can I just say --

5 MS. CHEN: Yes, certainly.

6 MR. STEIN: For purposes of your investigation, I
7 think it is -- I mean, I would concur with the petitioners,
8 that this is truly a commodity. You meet the specs. Once
9 you meet the specs, then what matters is price. Our point
10 is that there are -- there is a large universe of people,
11 who are trading fairly, who meet the same specs.

12 MS. CHEN: Thank you. And if you could, in your
13 post-conference briefs, could you please elaborate further
14 on business cycle and demand and how that has resulted in
15 oversupply in the last -- during the period of
16 investigation?

17 Can you respond to petitioners' argument that
18 antidumping duty orders on silicon metal imports from China
19 and Brazil inflated U.S. silicon metal prices?

20 MR. STEIN: Yeah, I'd like to respond to that.
21 They have not. I mean, the fact of the matter is -- again,
22 if you look at GE's auctions, they are selling to Brazil.
23 The Chinese are quoting -- I don't think -- do you have any
24 Chinese right now? Yeah, but there are -- there were
25 Chinese participants, who didn't get the business, who are

1 in this auction.

2 I think it's fair to say that the -- while there
3 is still Chinese participation in the U.S. market, it has
4 decreased since the time of the order and, possibly, as a
5 result, prices for silicon metals in other parts of the
6 world are lower than they are in the United States. But --
7 but whether that's a result of the U.S. antidumping order, I
8 think, is yet to be proved.

9 MS. CHEN: Okay. I ask this of the petitioners.
10 I'll ask this question again. Are domestic producers able
11 to satisfy silicon metal demand in the U.S. market or are
12 some level of imports necessary?

13 MS. HAYNES: Some level of imports are necessary.

14 MS. CHEN: Okay. Could you provide further --

15 MR. APPLEBY: I'm sorry, if I could also just add
16 to that. From what we understand, the U.S. current
17 production is less than 200,000 tons, but consumption in the
18 U.S. is about 400,000 tons. So just ballpark, about 50
19 percent will be satisfied -- 50 percent of consumption will
20 be satisfied to imports.

21 MS. CHEN: Thank you. Can you please address, in
22 your post-conference briefs, why the volume of imports from
23 Russia, as petitioners have alleged, declined slightly from
24 1999 to 2000? You can address that in your post-conference
25 briefs or now.

1 MR. WAITE: We can address that, yes.

2 MS. CHEN: Okay. When are contracts for the
3 purchase of silicon metal usually negotiated or renewed? Is
4 there some -- is there a particular time of the year that
5 these purchases go on?

6 MS. HAYNES: For GE silicon, it's the fourth
7 quarter -- typically the fourth quarter.

8 MR. APPLEBY: In the metallurgical side, they sort
9 of refer to the mating season for the long-term contract, an
10 annual contract, as being also the fourth quarter.
11 Typically, October, November is when negotiations take place
12 for the following year.

13 MS. CHEN: And how long are long-term contracts
14 normally in duration?

15 MS. HAYNES: For us, our long-term contracts are a
16 year.

17 MS. CHEN: A year.

18 MS. HAYNES: It's typically no longer than that.

19 MR. APPLEBY: And the same would be true on the
20 metallurgical side.

21 MS. CHEN: Okay. Can you please address, in your
22 post-conference briefs, the petitioners' allegation that
23 even though average unit values of Russian imports remain
24 the same, this is an effective decline in Russian prices,
25 because Russian producers have increased the quality of

1 their goods and have targeted sales to higher priced primary
2 aluminum and chemical markets?

3 MR. WILNER: We will address that untrue
4 allegation in our briefs.

5 MS. CHEN: And you please also address the
6 apparent anomaly in prices of Russian imports during the
7 last quarter of 2000 and first quarter of 2001, where the
8 average unit value of Russian imports was higher than U.S.
9 imports?

10 Do you agree with petitioners' contention that the
11 Metals Week dealer import price is a benchmark for silicon
12 metal prices and is considered indicative of U.S. trends?

13 MS. HAYNES: Chemical grade is typically not open
14 pricing and so I just don't look at Metals Week; I just
15 don't. I mean, we kind of set our own pricing based on what
16 we think we need to do, to manufacture our cost. So, Metals
17 Week is not a benchmark for us.

18 MS. CHEN: So, you just look for the lowest price?

19 MS. HAYNES: What we do is we look at what it
20 should cost to make the product and we set our targets based
21 on that.

22 MR. APPLEBY: Ms. Chen?

23 MS. CHEN: Uh-huh.

24 MR. APPLEBY: I would -- I'd like to respond. I
25 think that the Metals Week prices reflect what we would

1 refer to as spot sales, sales that take place for more or
2 less immediate delivery. However, the majority of SUAL's
3 business is concluded in those -- what we've referred to as
4 long-term contracts and Metals Week does not reflect those
5 prices.

6 MS. CHEN: Thank you. Yes?

7 DR. MAGRATH: I would say, however, that the -- as
8 Metals Week price going down is indicative of the -- one of
9 the indicators of this jungle of competition out there, from
10 all these sources, both foreign and domestic. That's what a
11 spot market typically does, in the current environment. So,
12 it accurately reflects the state of the market, in general,
13 in those trends, even if much Russian material isn't subject
14 to it.

15 MS. CHEN: Okay. Can you please address, in your
16 post-conference briefs, all the statutory threat factors,
17 including petitioners' claims in their petition, including
18 annual production capacity for silicon metal; foreign
19 producers plans to expand production capacity; whether or
20 not inventories of the subject imports are significant; and
21 whether or not there are any production facilities that are
22 currently not producing silicon metal, but may be in the
23 future?

24 Petitioners have also alleged that foreign
25 producers can also produce fair silicon, but that this

1 production capacity could also be converted to silicon
2 metal, if market conditions permit. Could you also please
3 address this, as well? And also whether or not the Russian
4 silicon metal market is export oriented.

5 Thank you. I have no further questions.

6 MR. FEATHERSTONE: Ms. DeFilippo?

7 MS. DEFILIPPO: Thank you, very much, for your
8 testimony. Mr. Appleby, I wanted to follow up briefly on
9 something that was just discussed with Ms. Chen, regarding
10 the Metals Week pricing, in terms of it being spot. And you
11 had noted that most of your business is done on contract
12 basis. We heard some discussion this morning that while
13 contracts are set for a year, maybe three months, maybe
14 more, that there is some give in prices, with regard to
15 meter release clauses that may allow prices to change within
16 the -- within the length of a contract. Do you have any
17 comment on that, in terms of do you have -- do you know if
18 there are provisions in the contracts that you deal with, do
19 prices actually change within the length or term of a
20 contract and do the published prices play any role in those
21 changes, if there are any?

22 MR. APPLEBY: I don't have any experience with the
23 domestic contracts. I can tell you from our experience, we
24 do not have any allowances for fluctuation of pricing. We
25 actually refer to it as take or pay. This is the price.

1 This is the quantity. We can work with customers, if their
2 requirements are lower, by extending the term of the
3 contract. If their consumption requirements are better, we
4 can speed up deliveries. But, we fix the quantity; we fix
5 the price.

6 MS. DEFILIPPO: Thank you. And I think it might
7 have been in either -- Dr. Magrath, you were talking about
8 the Russian producer not being capable of producing low iron
9 silicon metal and the lack of sort of competition there. If
10 you have any estimates of what percentage of overall
11 aluminum market sales that may account for, that will be
12 helpful, if you could submit that in a brief.

13 Actually to jump back maybe to Ms. Haynes, do your
14 contracts for your purchases contain meter release clauses
15 and do the prices that you pay tend to change during the
16 length of a contract or are they set for the period?

17 MS. HAYNES: No. Most of our contracts do have
18 meter release clauses and it's pretty much a requirement of
19 our legal team. But, they typically do not change that much
20 during the year.

21 MS. DEFILIPPO: What would -- if the chemical
22 market tends not to follow the published price, because it's
23 not really relevant to yours, what factors would play into
24 the price being changed during the term of a contract for --
25 and if any of this is confidential, I'd be happy to look at

1 it, in your post-conference submission.

2 MS. HAYNES: We should probably look at it there.

3 MS. DEFILIPPO: I guess one -- just one last
4 question for anyone. I think Mr. -- Dr. Magrath, in your
5 testimony, you talked about prices of non-subject imports
6 selling at prices lower than Russian imports and I think we
7 all touched on the non-subject. If this is a commodity
8 product, why are there any differences in price at all? I
9 mean, why are some lower than the others and why are some
10 higher?

11 MS. HAYNES: The difference -- if you take a
12 Chinese source, for example, the FOB prices should probably
13 not be any different. The difference is going to be freight
14 -- ocean freight. That should really -- that's our
15 argument. It should really be the only difference in price,
16 freight.

17 DR. MAGRATH: Cathy, you know, there are always
18 rigidities in the market place. It's a -- it's a -- both
19 petitioners and Mr. Stein alluded to, you know, there is --
20 there is near perfect information in this market, but it's
21 never perfect information. At any particular auction or
22 opportunity to sell, there might be certain, you know,
23 disconnects, in terms of temporary availability.

24 And, finally, I'd like to say that, you know,
25 reviewing for this, reviewing the sunset case, I was -- I

1 was struck, actually, by the number of -- you know, you guys
2 always do this table that shows the factors important in a
3 purchasing decision. Price was important, but it wasn't
4 number one. Availability was important. Ms. Haynes alluded
5 to, and this is not just GE, this would be every large
6 purchaser, the prohibition against sourcing everything from
7 a single source. So, you have alternate sources there.

8 And, finally, I think Canada is a very big factor
9 here, in terms of the injury suffered by the U.S. producers.
10 Because of the importance of availability and alternate
11 source and alternate safe sources to people like Ms. Haynes
12 and other large producers, people are looking and will pay a
13 premium as an alternative for U.S. production. U.S.
14 production is still more than 50 percent of the market after
15 all. And that alternative is Canada, in this case.

16 MR. STEIN: Can I answer --

17 MS. DEFILIPPO: Sure.

18 MR. STEIN: -- take a shot at your question? If
19 you will look at the information in the back of GE's
20 questionnaire, which is the minute by minute for auction
21 histories, and look at the final auction prices, you will
22 find that within a few dollars a ton, you have a producer
23 from the U.S., a producer from Russia, Brazilian producer,
24 Canadian producer. The answer is, this is a commodity
25 product and the price is what it is.

1 MS. DEFILIPPO: I thank you --

2 MR. STEIN: You're right. I mean, there is no --
3 there -- I don't know what the AUVs are showing, but what we
4 can tell you is that the price that purchasers pay is pretty
5 much the same, regardless of the supplier.

6 MS. DEFILIPPO: Actually, you reminded me of one
7 quick question I had for Ms. Haynes. Does GE tend to have a
8 desire to or practice dual sourcing or would you single
9 source just based at the lowest price?

10 MS. HAYNES: Dual sourcing; multiple sourcing, if
11 it's possible, actually.

12 MR. APPLEBY: If I could also add something.

13 MS. DEFILIPPO: Sure. Thank you.

14 MR. APPLEBY: I think GE's situation is somewhat
15 unique. GE, like Dow and even some of the large aluminum
16 consumers, is somewhat unique, in that especially for the
17 chemical users, the price of silicon is so significant to
18 the price of their finished product. I've heard it
19 represent something of like 40 percent of the cost of their
20 final product.

21 For many of the aluminum industries, silicon is a
22 small addition and it's not as significant. Therefore,
23 while Ms. Haynes may work very carefully to source at the
24 best possible price, a small aluminum consumer may be buying
25 from the same domestic producer for seven years and be

1 willing to pay 10 cents a pound more than the going market,
2 because it's just not that significant and there are other
3 attributes of buying from a domestic producer that is
4 important to them. They like the idea of having -- first of
5 all, there's a certainty of delivery. Imported metal,
6 unless you are a large buyer like GE, you have to count on
7 somebody else to deliver it, when you need it delivered.
8 The quality to be as -- as you're asking, it's very
9 difficult to check the quality of silicon metal. It looks
10 like a big pile of rocks. So, there's a certain amount of
11 confidence a buyer has when they buy domestic and they tend
12 to pay for that.

13 MS. DEFILIPPO: Great. Thank you, very much, for
14 your responses. It's been helpful.

15 MR. FEATHERSTONE: Mr. Mehta?

16 (No response.)

17 MR. FEATHERSTONE: Mr. Greenblatt?

18 MR. GREENBLATT: Yes. I was wondering if you
19 could discuss, either now or in a post-conference brief,
20 about the issue of production costs and, in particular,
21 electricity costs and how that might be a factor? And I'm
22 looking at both the U.S., the Russians, and the other, you
23 know, major -- major suppliers.

24 MR. WAITE: Yes, we can address that.

25 MR. GREENBLATT: You can put that in a -- okay;

1 fine. Are there any import restrictions on Russian silicon
2 metal from any country outside of the United States?

3 MR. WAITE: We're not aware of any. And at the
4 moment, there are no restrictions in the United States
5 either.

6 MR. GREENBLATT: Right. And could you discuss any
7 improvements that were made in recent years, in terms of the
8 quality of the Russian material, if any; in other words,
9 what actually may have transpired in a certain facility,
10 where they might have been able to increase the purity or
11 reduce the impurities of the product?

12 MR. WAITE: Yes, we can address that, but we'd
13 prefer to do that in our post-conference submission.

14 MR. GREENBLATT: Sure; sure. I have no further
15 questions.

16 MR. FEATHERSTONE: Ms. Noreen?

17 MS. NOREEN: Does anybody know of any other
18 auctions, other than GE?

19 MR. APPLEBY: Yes. We have participated in one
20 auction in the fourth quarter of 2001 for one of the auto
21 makers, to supply them silicon metal for 2002. There have
22 been other auctions, as well, that we're aware of.

23 You know, I tried to address that somewhat in my
24 original statement. The process is really not that much
25 different in the way we've been doing business for the past

1 20 years. It just -- it just adds to the transparency of
2 the commodity. If you are a small buyer in the middle of
3 Alabama, you may not have the inclination to or the ability
4 to contact many different people. But the Internet has done
5 in generally -- in general, has given everybody access to a
6 wider market. So, it just makes it more transparent,
7 because more people are participating.

8 DR. MAGRATH: I'd like to add to that and it's
9 actually just paraphrasing what Mr. Appleby told us
10 yesterday. The process by phone call and fax is also a
11 "reverse" auction, in this economic -- in this market and
12 economic environment, conducted by people -- buyers at large
13 industrial concerns, of chemical and aluminum concerns,
14 whose business is, like Ms. Haynes, to buy this material and
15 to buy it at the cheapest -- at the cheapest price from the
16 qualified supplier. So, whether it's over the Internet or
17 whether it's done by fax, phone, and it's got to go back and
18 forth a little bit, in terms of negotiation, once again, the
19 picture is the same, a reverse auction and a flood of
20 offerors from numerous competitors, foreign and domestic.

21 MR. WILNER: May I make one final point? I was
22 impressed during the petitioners' testimony this morning,
23 how they emphasized the auction process and seemed to
24 complain about it, almost as if the auction process had been
25 a cause of their problems. And it seems to me, tying

1 together with what they said, that if you have the small
2 buyers now in Alabama, through the -- Alabama, not picking
3 on Alabama; it could be a small buyer anywhere. I like
4 Alabama. But if you have a small buyer, who now through the
5 Internet has access to a wider range of alternative supply,
6 it might be a problem, at this time, where there is an
7 enormous amount of alternative supply available. And that's
8 just what's happening, alternative supply from a range of
9 fairly traded imports around the world, and that's becoming
10 -- access to that is becoming available.

11 MS. NOREEN: I think, Cathy, didn't you ask that
12 they provide the low iron silicon metal? Is there any --
13 can anybody do that publicly now, rather than -- rather than
14 later -- I mean, any estimate as to how much of the market
15 would be this low iron silicon metal?

16 MR. APPLEBY: The only -- we don't have any
17 statistics available at this time and then I'm not sure -- I
18 don't know whether we can make those statistics available.
19 We can certainly try. But what I did want to just explain
20 is that one of the largest buyers, primary aluminum buyers
21 of silicon recently tendered out for their requirements. It
22 was about 24 million pounds, of which about 75 percent of it
23 was irons between .18 and .20 maximum. I don't know how
24 indicative that is of the overall metallurgical market.
25 But, clearly, there is a significant portion of the market,

1 where they require this low iron material.

2 MS. NOREEN: I had written down in my notes that
3 you had said 14 million. It's 24 million pounds then?

4 MR. APPLEBY: I'm sorry, 14 -- you're correct,
5 it's 14 million.

6 MS. NOREEN: Fourteen million. Okay. I think
7 that's all my questions. Thank you.

8 MR. FISCHER: Fred Fischer, Office of
9 Investigation. I just have one final question. Mr. Waite
10 and Mr. Wilner, to the extent that your clients also produce
11 ferrous silicon or other products in the same plants, using
12 similar equipment, like furnaces, if you could explain any
13 switches either to ferrous silicon or to silicon or other
14 products, in your post-conference briefs. Thank you.

15 MR. WAITE: Mr. Fischer, it's our understanding
16 that our client, the SUAL producers, do not make ferrous
17 silicon at their plants. We will confirm that and provide
18 that information to you, in our post-conference submission.

19 MR. WILNER: And I simply have no idea, but I'll
20 find out and I'll --

21 MR. FISCHER: Thank you.

22 MR. FEATHERSTONE: Thank you all again for your
23 testimony and answers to the questions. We'll take about a
24 10-minute break and resume for closing statements. Thank
25 you.

1 (Whereupon, a brief recess was taken.)

2 MR. FEATHERSTONE: Can we resume the conference,
3 please? Welcome back, Mr. Kramer. Please proceed.

4 MR. KRAMER: Thank you. I would like to first
5 point out that in their presentations, the respondents made
6 very important concessions about a number of elements of our
7 case.

8 As I understood their testimony, they have
9 conceded the injured condition of the domestic industry.
10 Second, they outlined a number of the factors that have
11 contributed to the vulnerability of the industry to injury,
12 by reason of unfairly traded imports. In very graphic
13 truthful testimony, they acknowledged that silicon metal is
14 a commodity product, including -- grade material, and that
15 purchase decisions are based on price.

16 They've invited the Commission to focus on the on-
17 line auctions, including specifically the GE auction. We
18 embrace that suggestion and we think that that auction
19 unequivocally shows injury by reason of dumped imports from
20 Russia. We think that's reflective in the outcome of the
21 auction, as well as in the bidding.

22 I'd also like to focus the Commission on the fact
23 that the respondents' testimony really is very misleading,
24 as their auction was to bidders, in one important respect.
25 They have characterized that auction as bidding among

1 sources of fairly traded material. And they have now
2 publicly acknowledged that bidders included suppliers from
3 the Peoples Republic of China, which is a country subject to
4 order, with 139.49 percent duty deposit rate in effect,
5 which applies to all sources.

6 There also was the suggestion that there are
7 Brazilian producers no longer subject to the dumping order.
8 There are some producers, who currently have zero or low
9 deposit rates, but -- and others with high rates. The order
10 remains in place as to all Brazilian producers. Whether or
11 not particular bids in a current auction are dumped prices
12 will be determined in administrative reviews. And, of
13 course, another bidder was Russia, which is selling unfairly
14 traded material.

15 They, at one point in their testimony, pointed to
16 seven sources with lower AUVs. We'll go back and look at
17 exactly what the specifics are of that, but the Commission
18 needs to focus on the question of what product these
19 suppliers are selling. And in the case of the Russian
20 material, a substantial portion of the volume is chemical
21 grade material.

22 They have argued that there will be no price
23 effect, if the Russian imports were to disappear tomorrow.
24 Independent observers in the trade press would not agree
25 with that portrayal. In addition, the market reaction to

1 the filing of this case, which immediately led to an
2 increase in price, disproves that suggestion.

3 Finally, with respect to the suggestion that there
4 are many alternative fairly traded sources that would
5 replace the Russian material, I'd point out that the Russian
6 material has gained volume and market share from both the
7 domestic industry and fairly traded imports, as the
8 Commission would expect to see, when it is dealing with
9 unfairly traded imports that are causing injury.

10 MR. BUTTON: Ken Button from Economic Consulting
11 Services. The respondents' case is larger than if the
12 duties are imposed, it won't do the domestic industry any
13 good, because prices won't go up. Fortunately, the exhibit
14 suggests otherwise. In a commodity product, you gain market
15 share by having lower price. This shows that during this
16 period we're looking at, it was the Russian material that
17 gained market share. They are the price leaders. Why else
18 would the other volumes decline? It's clear that if you
19 have an order, the reason for the lower prices will be
20 removed.

21 MR. KRAMER: At this early stage in the
22 proceeding, it is already clear that the domestic silicon
23 metal industry is gravely injured. Material injury is not
24 an issue in this case. The causal connection between the
25 dumped imports from Russia and the material injury to the

1 domestic industry also is clear. The significant and
2 growing volume and low prices of the Russian imports have
3 depressed U.S. market prices. The dumped imports have
4 gained volume and captured increased market share, while the
5 U.S. producers and other market participants have lost
6 shipments, volume, and market share.

7 The imports are penetrating all segments of the
8 market, including the chemical producer segment. The
9 commodity nature of silicon metal and the conditions of
10 competition in the silicon metal market require domestic
11 producers to meet the prices of the dumped imports or lose
12 sales. Even when U.S. producers are not competing head to
13 head with the Russian imports for a particular sale, their
14 prices are being driven down by the dumped imports impact on
15 published market prices and price indices used in long-term
16 contracts. On-line auctions by major customers have
17 accelerated the process by which injury is being inflicted.
18 Without question, the Russian import are causing material
19 injury to the domestic industry.

20 The threat of further material injury is also very
21 real. The Russian producers are highly export oriented and
22 they are focused on the United States market. They possess
23 significant excess production capacity and they have
24 targeted the United States to receive the vast majority of
25 their production destined for export. And as you have heard

1 in the testimony today, right now, the Russian producers are
2 going all out to get their product into the U.S. market
3 before antidumping duties are imposed.

4 For all of these reasons, absent relief, the
5 Russian imports will continue to enter the United States in
6 volumes and at prices that will seriously depress and
7 suppress U.S. market prices and will have a devastating
8 impact on the domestic industry. On behalf of the
9 petitioners, we ask the Commission to find, as the record
10 evidence shows, that there is a reasonable indication of
11 material injury and threat of further injury to the U.S.
12 silicon metal industry by reason of the dumped imports from
13 Russia.

14 MR. FEATHERSTONE: Thank you, Mr. Kramer, Mr.
15 Button. Welcome back, Mr. Stein.

16 MR. STEIN: Thank you. For the record, Michael
17 Stein. At the outset, I'd like to just note that imports
18 from countries under order are, by law, fairly trade, if --
19 because duties are imposed, to the extent that they are sold
20 at less than fair value. So, obviously, Russian -- Chinese
21 and Brazilian imports are fairly traded, as are imports from
22 Canada, South Africa, Korea, any number of other places.

23 The Commission has the information it needs to
24 decide this case now. As we've said earlier, other than the
25 question of what's causing the distress to the U.S.

1 industry, we don't have any particular quarrel with what the
2 petitioners have been saying. And in a sense, I feel for
3 them. I'm often in their position. The domestic industry
4 lost sales. It doesn't always know to whom it lost the
5 sale. All it knows is, went through it's company; goes to
6 the customer; the customer says, I can buy it cheaper, I'm
7 not going to buy it from you. They see Russian imports
8 increasing. They think, aah, it must be the Russian
9 imports.

10 Look at the record. In this case, what we have is
11 something unusual. We have something more than anecdote.
12 We have actual information on who offered what, when. And
13 what we can show you is that neither petitioning company, in
14 the case of my client, General Electric, was willing even to
15 participate at the opening price. They didn't need Russian
16 imports. There were numerous fair value, fairly traded
17 imports prepared to under -- to sell to GE for less than the
18 domestic industry was willing even to begin the auction at.

19 In these circumstances, the law is clear. The
20 fair value imports are an intervening cause of injury, since
21 -- and in those circumstances, a negative determination is
22 not only justified, it is compelled. And I urge the
23 Commission to look at what amounts to a complete record.
24 There is no information -- more information you really need.
25 Make a determination that the Russian imports are not

1 causing injury, because of -- because they are dwarfed by
2 fair value imports and find what I think this record does
3 compel, which is there is no reasonable indication of
4 injury.

5 Thank you, very much.

6 MR. FEATHERSTONE: Thank you, Mr. Stein. Any
7 other closing comments?

8 (No response.)

9 MR. FEATHERSTONE: A couple of quick reminders.
10 The deadline for the submission of corrections to the
11 transcript and briefs on this investigation is next Tuesday,
12 April 2. If briefs contain business proprietary
13 information, the non-proprietary version is due the
14 following day. The Commission has scheduled its vote on the
15 investigation for 2:00 p.m. on Thursday, April 18th, and it
16 will report that determination to the Secretary of Commerce,
17 April 22. Commissioner's opinions will be transmitted to
18 Commerce and placed in the public record a week later, on
19 April 29th.

20 I would like to thank all the parties for
21 accommodating the schedule for this conference a little bit
22 earlier than usual, to avoid the holidays later in this
23 week. We appreciate that. Also, I'm advised that there
24 will be an APO release on the 28th. Anything today?
25 Nothing?

1 MR. FISCHER: I think today. It may come
2 tomorrow.

3 MR. FEATHERSTONE: Okay. We don't have anything
4 today, but we'll notify parties if there's anything before
5 that. Thank you, again, for your participation. This
6 conference is adjourned.

7 (Whereupon, at 12:35 p.m., the preliminary
8 conference was concluded.)

CERTIFICATION OF TRANSCRIPTION

TITLE: SILICON METAL FROM RUSSIA

INVESTIGATION NO.: 731-TA-991 (Preliminary)

HEARING DATE: March 26, 2002

LOCATION: Washington, DC

NATURE OF HEARING: Preliminary Conference

I hereby certify that the foregoing/attached transcript is a true, correct and complete record of the above-referenced proceeding(s) of the U.S. International Trade Commission.

DATE: March 26, 2002

SIGNED: LaShonne Robinson
Signature of the Contractor or the
Authorized Contractor's Representative
1220 L Street, N.W. - Suite 600
Washington, D.C. 20005

I hereby certify that I am not the Court Reporter and that I have proofread the above-referenced transcript of the proceeding(s) of the U.S. International Trade Commission, against the aforementioned Court Reporter's notes and recordings, for accuracy in transcription in the spelling, hyphenation, punctuation and speaker-identification, and did not make any changes of a substantive nature. The foregoing/attached transcript is a true, correct and complete transcription of the proceeding(s).

SIGNED: Lorenzo Jones
Signature of Proofreader

I hereby certify that I reported the above-referenced proceeding(s) of the U.S. International Trade Commission and caused to be prepared from my tapes and notes of the proceedings a true, correct and complete verbatim recording of the proceeding(s).

SIGNED: Sharon Bellamy
Signature of Court Reporter
